## **Introduction**

Valid and timely nutrition assessment is the foundation on which effective interventions and programmes can be built to improve the food and nutrition situation of people. Standardized indicators are crucial for making cross-country comparisons, for estimating trends, and for evaluating programmes and policies for improving food and nutrition security and nutritional status.

In the framework of the European project: *Support the strengthening of the National Food Security Information System*, the Food and Agriculture Organization of the United Nations (FAO) held a 3-day training course on the use of the *Dietary Diversity Tool for Food Security and Nutrition Programmes in Tajikistan*.

The main purpose of the workshop was to build capacity to validly and accurately assess the impact of actions for improving food and nutrition security through the use of a simple and valid food-based tool. The training course was focused on providing training and practical experience using the Dietary Diversity (DD) tool.

Dietary diversity is defined as the number of food groups consumed over a given reference period. The DD tool uses a qualitative open recall method to gather information on all the foods and drinks consumed over the previous 24 hours, which are then classified into standard food groups. It can be administered either at the household or individual level. This tool is particularly useful for assessing whether agricultural development, food security and nutrition education programmes effectively lead to more nutritious diets.

This tool, being easy to implement and analyze, is very relevant for countries, both at national as well as decentralized level. The training course combined lectures, exercises and field work (see Annex 1 for the workshop agenda). In Dushanbe, the first and last day of the workshop took place in the conference room of the Atlas hotel where lectures and group exercises covered the basic concepts of the DD tool, how to implement it and analyze the data, and its relevance for impact assessment and monitoring, and for evaluation frameworks. During the second day of training, the participants learned how to adapt DD to the local context through key informants and focus group discussions and to administer the DD questionnaire to individuals at household level.

The workshop was attended by participants from Ministries of Agriculture, Health, Economic Development and Trade, National Statistics Office, Centre for Strategic Research under the President of Republic of Tajikistan and staff of the FAO office in Tajikistan.

## **Training course summary**

### **Day 1 – Classroom**

The Training course was opened by Dr Sanginboy Sanginov, National Programme Manager of the EU funded project on *Support the strengthening of the National Food Security Information System* in Tajikistan who welcomed all participants and briefly addressed the importance of conducting this training course in the context of improving food and nutrition security information systems in the country. He then wished a successful workshop to all the participants and facilitators.

The floor was then given to the participants with a round of introductions, to share with the rest of the group their profession, organization they are working in and possible previous experience with nutrition assessment tools.

The first presentation was an overview of the nutrition situation in Tajikistan summarizing the main nutrition issues in the country and mentioning that stunting, iodine deficiency and maternal and child anemia represent the largest burden of malnutrition at national level. The MICS survey of 2005 showed a very low rate of exclusive breast-feeding. The proportion of infants fed according to WHO recommendations was also low, reaching 50 percent in only a few regions and age groups. According to 2009 figures, around 29 percent of children under five years of age in all regions of the country were stunted. Approximately half of the population of children and women of child bearing age were iodine deficient. Anemia affected 29 percent of children and 24 percent of mothers. Some parts of the country, namely of Ghorno-Badakhshan Autonomous Province and directly ruled districts, suffer from an even higher burden of malnutrition. It was estimated that about USD 15 million could be saved annually if the appropriate nutrition interventions were implemented. Moreover direct nutrition interventions would bring a high development return for the country.

Dr Warren T.K. Lee from the Nutrition Division, FAO, Rome, reviewed the workshop objectives and training plan. He emphasized that the Dietary Diversity Score tool can be used for food and nutrition security assessments both at household and individual level. The DDS is a measure of dietary quality and is a proxy of adequacy of macronutrient and micronutrient intakes. Below are some of the potential uses that were mentioned during his presentation:

At national level the DDS can be used:

1. To monitor the quality of the dietary intakes of the population sub-groups
2. To monitor and evaluate agro-food and nutrition intervention programmes (baseline and impact indicators)
3. In Early warning systems and vulnerability assessments of countries

At global level:

1. It provides standardized indicators and methodology to monitor and compare quality of dietary intakes within countries, across countries and over time
2. It allows cross-cultural comparisons of dietary intakes in different regions

3. It provides timely data to inform early warning systems for preparation of actions to ensure food security and to prevent starvation or famine

During this training course, participants would familiarize themselves with the DD tool methodology, would learn how to adapt the tool to the local context and how to apply it practically during the field exercise, how to analyze the collected data and critically consider strengths and weaknesses of the tool according to their country specific needs.

He mentioned that, during the second day of training, there would be guided interactions between participants and local people in the selected village to familiarize with the tool and the methodology of data collection.

In view of the fact that this was the first training course organized by FAO in the central Asian region on nutrition assessment methods, FAO was aware that the participants and their institutions would need continuous support and close follow-up in order to apply the DD tool. It was pointed out that **the nutrition assessment and nutrients requirements team in the Nutrition Division of FAO, could provide national institutions with further capacity development activities and direct technical assistance in order for them to make effective use of this tool.**

Participants were then asked to individually express their expectations which are summarized below:

1. Principles and practical application of the DD tool in the field
2. Learn how to analyze different dietary indicators
3. Be trained on the best way to convey nutrition related information to the media
4. Learn the methodology to conduct surveys, particularly using the DD methodology
5. Understand the relevance of this seminar for the health sector
6. Improve the food and nutrition security as well as the living standard of the Tajik population
7. Be able to conduct nutrition need assessments at country level

The rest of the day was dedicated to the technical presentations by Ms Marie-Claude Dop, including an overview of the development of the DD indicators, its validation and an in-depth description of the DD tool: In the overview, the rationale for developing the dietary diversity tool was presented and the evidence base for dietary diversity as a valid proxy of the adequacy of nutrient intake was described. Dietary diversity is an indicator of food security when it is used at household level (assessing access to foods) and a nutrition indicator when used at individual level (an indicator of the nutritional quality of the diet). The general principle of the measurement of DD was presented, including the different steps for its practical implementation. The importance of standardization was emphasized. Uses of the tool were briefly outlined.

In the afternoon, Marie-Claude Dop and the reporting officer (Giorgia F. Nicolò) provided a practical demonstration (role-play) of the method to conduct individual 24-hour recall interviews at household level, how to classify the collected information into the table of food groups and probe the respondent for food groups not spontaneously mentioned.

Participants were invited to practice the method in tandems and then report in plenary the difficulties they encountered. According to their feedback, the demonstration of the method was clear during the role play. However, some of the diets that they reported for the previous day were very monotonous and participants expressed uncertainties on how to fill the 24hour recall table based on such information. It was then clarified that the recall method is meant to capture the diet of the individual on usual days and that, although this is not always possible, interviewers should aim at collecting information reflecting a typical diet. Days when the diet is atypical (such as feast days and ceremonies) should be excluded. The fact that the first day of the training workshop was the eve of the major religious celebration could explain why atypical diets were reported by the participants. Therefore, it was stressed that, adequate planning of the interviews at household level should be performed before visiting the village for interviewing.

The progress of the workshop was slowed down considerably due to the need for simultaneous translation of all the presentations and discussions into the local language.

The session was closed at 4.30 p.m. (1 hour earlier than scheduled) to allow participants to reach their homes and prepare for the following day's religious celebration. This anticipated closure obliged the facilitators to skip some of the lectures which presentation was postponed to the last day after the field trip.

## **Day 2 – Field work in Hissoar jamoat (village of Hisor)**

The second day of the workshop was dedicated to “hands on practice” in a village setting, to adapt the DD tool to the local context and to allow the participants to practice conducting discussions with key informants and focus groups while gaining experience with administering the questionnaire in a household setting.

### ADAPTATION PROCESS

Activities of the second day started, in the morning, by interviewing several key informants (the complete list of the key informants interviewed is available in annex 3) and a focus group discussion (FGD) with a group of women (approximately 9 women of different age). Conducting FGDs in areas which will be part of survey data collection is a recommended procedure for adapting the DD questionnaire. The discussions dealt with the local food systems, including traditional and indigenous food availability, ingredients of commonly prepared mixed dishes including possible variations in the preparations of these dishes, and foods/ ingredients consumed in very small quantities.

In particular, the facilitators and participants worked on the following questions, among others:

- What are the most commonly eaten foods in this area?
- What are the most common mixed dishes and what are the ingredients which go into these dishes?
- What are the foods which will be seasonally available during the data collection period?
- What are the most common foods gathered from the wild? Think of green leafy vegetables, wild fruits, fish, insects, other small animals.
- Are there any vegetables or roots/tubers which have a dark yellow, or orange colored flesh inside?
- Are there any fruits available with dark orange, inside flesh?

With the retrieved information, participants were able to adapt the table of food groups to the local context (i.e. insert local foods in each of the food groups) and also collect information on the most common mixed dishes prepared and consumed in the area.

In the afternoon, participants were taught how to classify foods listed during the morning's exercise, into the food groups. This discussion was handled in plenary and participants showed interest and engagement. Summarized results from the discussion with the key informants, focus group discussion with the women and food classification can be found in annex 4 and 5 of this document.

### IMPLEMENTATION PROCESS

Following the classification exercise, small teams of about five to six persons each (1 facilitator, 1 interpreter and 3-4 participants) conducted household interviews, where the DD questionnaires were administered to one woman of reproductive age living in each household. Unfortunately, due to time constraints and the need of returning back to Dushanbe before dark, not all participants had the opportunity of personally conducting the household interviews (a total of 5 interviews were conducted). But they had the opportunity to observe 1 or 2 colleagues in action, so that they could learn how to handle the household interview.

At 5 p.m. transportation back to Dushanbe was arranged.

In the evening Marie-Claude Dop, Warren T.K. Lee and the reporting officer had a meeting to debrief on the field trip and make the required adjustment to the agenda for the following day (mainly to include presentations skipped on the first day).

### **Day 3 – Classroom**

Day three of the training course began with the presentation of the new agenda for the day which included the sessions skipped during the first day.

The process of coding the DD questionnaire was explained. The steps of the analyses of the survey data were described, e.g. including percent of subjects consuming each food group, constructing DD scores

and indicators of special nutritional interest and assessing dietary profiles. DD scores are constructed differently for infants and young children and for women.

### Debriefing of the field work

Participants were asked to reflect individually and then discuss in small groups, on how the adaptation and implementation process went. To stimulate the discussion and recapitulate impressions and observations from the field work, a brief overview of the adaptation and implementation process of the tool was provided by Marie-Claude Dop.

Although the DD tool is universal, it needs to be adapted to the local context. Terms to be used in local language for setting questions need to be carefully chosen and used in a consistent way. A list of local foods needs to be developed, with names of foods in local language. Classification of all the foods in the appropriate food group needs to be done before a survey can be conducted. The list of local foods is integrated in the questionnaire that will be used in the field. Special cases, such as foods consumed in very small quantities, need to be discussed and decisions made for their classification. An inventory of common mixed dishes, including all usual and optional ingredients, is developed and field interviewers will use it for probing respondents when mixed dishes are consumed.

In addition, some of the comments and questions arising from the fieldwork were posed to the participants:

- Did the participants feel that the exercise we did yesterday was an appropriate procedure for adaptation and pretest of the tool?
- Were the different steps of the adaptation and implementation process clear?
- What would you have done differently and why?

The following points were mentioned in group discussion:

- ✓ For the adaptation process, participants felt that preliminary adaptation work should be carried out before going to the field as this is a process that requires more time, especially when interviewers are not familiar with the local culture.
- ✓ When adapting the questionnaire into the local culture, a nutritionist should be involved the reason being that participants were not always sure on how to classify certain foods (e.g. to properly include the vitamin A rich foods into the right groups as well as make decisions on how to consider certain foods rich in nutrients but often used in variable quantities according to the local habits e.g. chili).
- ✓ Only some participants had the opportunity to actively take part in the FGD with the local women, due to time constraints.
- ✓ In the implementation process, participants felt that the household interviews went well as the methodology had been clearly explained. However and given the celebration of the *Idi Qurbon*, interviewed people had been eating a great variety of foods and meals outside of their homes. This means that the reported diet is not representative of the typical diet of the region. In addition, the region where the interviews were conducted is considered a well-off area of the

country, which again, does not reflect the average food and nutrition security situation of the country.

- ✓ Participants were uncertain on how to classify and handle information regarding fortified foods: whether these should be recorded separately or not considered at all, and how to conduct an interview when the person consumed tinned foods.

Clarification was given that the field day was to demonstrate the adaptation process and provide an opportunity to practice using the DD tool. The adaptation process may require several days of key informant interviews and focus group discussions in communities with diverse food cultures. Normally, time is needed after the FGD to synthesize the information and incorporate these changes into the questionnaire forms.

Clarification was given that DDS is normally based on recall of one day and that it provides a picture of the population not of the individual. The number of days of data collection should be planned to cover proportional numbers of week days and weekend days to gain a representative picture of the dietary diversity at population level: the dietary diversity tool is not meant for individual nutrition or diet assessment

#### Examples of the use of the tool for FAO field programmes

Results and interpretation of DD survey data collected by FAO were presented (from Mozambique, Benin and Mali). The exercise of analyzing survey data had to be canceled because of lack of time.

Uses of the DD tool in the framework of FAO programmes were reviewed and strengths and limitations of the tool were discussed.

#### Discussion on how the participants would use the DD tool

Where and how do you think this tool could be used in your own country?

- Participants from **Agency of Statistics** mentioned that they regularly carry out Household Budget Surveys (HBS) at National Level. However, these surveys do not cover any aspect of dietary consumption either at individual or at household level and the DDS could be easily introduced to collect the nutrition related information. The constraint is the budget and capacity considerations for adding this indicator.
- Participants from the **Ministry of Health** reported that they are conducting quantitative food consumption surveys but data are still to be processed and do not cover the whole country. This is due to the fact that in some regions, mainly located in remote mountainous areas, can only be reached during summer season.
- The **FAO Tajikistan food security officer** acknowledged that this method is easy to use and can represent a useful tool to be used by government institutions. However, qualitative information is not enough in some regions of the country where the main problem that needs to be addressed is still the insufficient amount of energy of the diet (calorie consumption).

- Participants from the **Ministry of Economic Development and Trade** and the **Centre for Strategic Research** both stressed the importance to conduct food consumption surveys not only in the more well-off districts but also in the most vulnerable areas which are often difficult to reach and where the usual diet is frequently based exclusively on bread. Governmental institutions should receive support, both in terms of finance and capacities to conduct nationwide surveys, and to analyze and report data from these areas.

After this discussion, evaluation questionnaires were distributed to participants and cumulative results are reported in annex 7.

## **Concluding remarks and recommendations**

The participants provided a satisfactory evaluation of the training workshop. They felt that the workshop was useful and of good quality. One limitation that they noted was that the examples used for illustrating the DD tool, mostly came from surveys conducted in Africa, which were not very relevant to their context. Nevertheless they concluded that dietary diversity could be employed for use in food security and nutrition monitoring and evaluation in Tajikistan.

Dr. Warren T.K. Lee concluded that follow-up communication will be ensured, through the FAO country office in Tajikistan, to provide necessary technical support to the national institutions for including the DDS tool in their national surveys.

## **Closing of the training course**

Closing remarks and acknowledgements were then expressed by Dr. Warren T.K. Lee, Mr. Tomasz Lonc, FAO representative in Tajikistan, Mr. Norov, Deputy Director of the State Agency of Statistics under the President of Tajikistan and Sanginboy Sanginov, FAO National Programme Manager.

**Annex 1.** Agenda of the *Training course on the use of the Dietary Diversity Tool for Food Security and Nutrition Programmes in Tajikistan*

Dushanbe, Tajikistan, 14-17 October 2013

Norov, Deputy Director of the state agency of statistics under the President of Republic of Tajikistan/Sanginboy Sanginov, National Programme Manager | Evaluation questionnaires           |

**Annex 2.** Participants to the Training course on the use of the *Dietary Diversity Tool for Food Security and Nutrition Programmes in Tajikistan*

|    | <b>Participants</b> | <b>Position</b>   | <b>Organization</b>   |
|----|---------------------|---|---|
| 1  | Mr. M. ODINA        | Chief Specialist of Agrarian Enterprise and Ecology Unit  | Ministry of Economic Development and Trade                                  |
| 2  | Mr. A. MUROTALIEV   | Chief Specialist of Agrarian Enterprise and Ecology Unit  | Ministry of Economic Development and Trade                                  |
| 3  | Ms. M. KHAMIDOV     | Chief Specialist of Trade Policy and Services Department  | Ministry of Economic Development and Trade                                  |
| 4  | Mr. F. SALIMOV      | Chief Specialist of Sanitary-Epidemiological Safety, Emergency Situations and Emergency Medical Care Department | Ministry of Health  |
| 5  | Mr. Kh. KHAIROV     | Director of Republican Nutrition Centre   | Ministry of Health  |
| 6  | Mr. A. KANDAKOV     | Deputy Food Hygiene Unit  | State Sanitary and Epidemiological Surveillance, Ministry of Health         |
| 7  | Ms. M. YAKUBOVA     | Vice President  | Academy of Sciences   |
| 8  | Mr. S. MURODOV      | Specialist of the Crop Department   | Ministry of Agriculture   |
| 9  | Mr. A. ABDULOEV     | Chief Specialist of Livestock, Poultry, Fisheries and Beekeeping Department                                     | Ministry of Agriculture   |
| 10 | Mr. L. RAKHIMOV     | Senior Specialist of Food Security and WTO Sector at the Agrarian Reform and Food Security Monitoring           | Ministry of Agriculture   |
| 11 | Mr. A. MAKHMADOV    | Senior Specialist of Sectoral Development Department  | Centre for Strategic Research under the President of Republic of Tajikistan |
| 12 | Ms. Kh. BEGOVA      | Chief Specialist of Demographic Statistics and Employment of Population Department                              | Agency of Statistics under the President of Republic of Tajikistan          |
| 13 | Ms. B. SHARIPOVA    | Head of Department for Price and Tariffs Recording and Households Budget Research                               | Agency of Statistics under the President of Republic of Tajikistan          |
| 14 | Ms. Z. GULOMJONOVA  | Deputy Head of Department for Price and Tariffs Recording and Households Budget Research                        | Agency of Statistics under the President of Republic of Tajikistan          |
| 15 | Mr. K. SAFAROV      | Head of Protection and Competition Development Department   | Antimonopoly Service under the Government of Republic of Tajikistan         |
| 16 | Mr. F. AFSAHZOD     | Database Management Specialist  | FAO   |
| 17 | Mr. R. SHUKUROV     | Food Security Analyst   | FAO   |
| 18 | Ms. M. BUDANAeva    | National Project Assistant  | FAO   |
| 19 | Mr. S. SANGINOV     | National Project Manager  | FAO   |

**Annex 3.** List of key informants interviewed during the 2<sup>nd</sup> day of the training course

| List of key informants |   |
|------------------------|---|
| 1                      | Mr. Alimahmud Saidov, Head Physician of the Health Centre, Hisor village    |
| 2                      | Mr. Khurshed Kosimov, Head of Statistics Agency in the Hisor district       |
| 3                      | Mr. Sirojiddin Karimov, Deputy Chairman of the Hisor Jamoat (local council) |
| 4                      | Mr. Ilhom hafizov, Senior Statistics Specialist                             |
| 5                      | Mr. Sharipov, community teacher   |
| 6                      | Mr. Olimov, head of farming ownership                                       |

**Annex 4.** Examples of locally available foods classified into the DDS food groups

| Group | Food groups                                 | Locally available foods  |
|-------|---|--|
| 1     | <b>Cereals</b>                              | Wheat, barley, buckwheat, oats, maize, rice, sorghum   |
| 2     | <b>White roots and tubers</b>               | White sweet beetroot, red beetroot, white and red potato   |
| 3     | <b>Vitamin A rich vegetables and tubers</b> | Pumpkin, carrot, red sweet pepper, chili pepper, squash  |
| 4     | <b>Dark green leafy vegetables</b>          | Dill, coriander, mint  |
| 5     | <b>Other vegetables</b>                     | Cabbage, cauliflower, garlic, cucumber, radish, leek, tomato, onion, eggplant  |
| 6     | <b>Vitamin A rich fruits</b>                | Apricot and dried apricot, peach and dried peach   |
| 7     | <b>Other fruits</b>                         | Persimmon, apple, peaches, banana, lemon, watermelon, mandarin, grapes, apples, pears, melon   |
| 8     | <b>Organ meat</b>                           | Liver, kidney, heart, lung   |
| 9     | <b>Flesh meat</b>                           | Beef, mutton, goat, rabbit, chicken, goose, turkey, quail, cheeks, sausages, horse meat, pork  |
| 10    | <b>Eggs</b>                                 | Quail eggs, chicken eggs, goose eggs, turkey eggs  |
| 11    | <b>Fish and sea foods</b>                   | Fresh and frozen fish, smoked fish   |
| 12    | <b>Legumes, nuts and seeds</b>              | Mung bean, sesame seed, pistachios, almonds, pumpkin seeds, flaxseed, sunflower seeds, walnuts, peanuts, peas, red beans, white beans, lentils |
| 13    | <b>Milk and milk products</b>               | Sour milk, cottage cheese, yoghurt, qurut (dried yoghurt), curd, ice-cream, cream  |
| 14    | <b>Oils and fats</b>                        | Vegetable oil (sunflower, flax, sesame, cotton), butter  |
| 15    | <b>Sweets</b>                               | Sugar, honey, candies, chocolate, cakes, biscuits, jam   |
| 16    | <b>Spices, condiments, beverages</b>        | Lemongrass, black pepper, salt, coffee, black and green tea, alcohol, fruit drinks ( <i>compote</i> ), sweet soda                              |

**Annex 5.** Most common mixed dishes classified by meals

|    |  |
|----|--|
| 1  | <p><b>Breakfast</b></p> <p>Rice porridge (milk, rice porridge and sugar)<br/>         Atala (wheat porridge made of fried white flour to obtain a mixture which is then boiled and seasoned with sugar)<br/>         Egg (s)and sausages<br/>         Tea and milk<br/>         Shirrakadou (pumpkin boiled into milk)<br/>         Boiled eggs<br/>         Pancakes<br/>         Fried potatoes</p>  |
| 2. | <p><b>Lunch</b></p> <p>Chagaldak (fried dough and herbs)<br/>         Mantu (steamed dough, meat (or pumpking) and onion)<br/>         Sambusa (dough, meat, onion, cooked in the traditional oven-tandoori)<br/>         Tuppa (boiled dough cut in small pieces, vegetables served with boiled vegetables (beans, peas, coriander)and herbs)<br/>         Qurutob (wheat, butter, cucumber, tomato)<br/>         Soup<br/>         Krutone (small pieces of bread soaked in hot water, yoghurt and cucumber can be added, tomato, salad, fried onion and oil. Local variations can include butter or flux oil)<br/>         Rice soup<br/>         Noodle soup<br/>         Salad<br/>         Tea<br/>         Fruits</p> |
| 3. | <p><b>Dinner</b></p> <p>Similar to lunch</p>   |
| 4. | <p><b>Snacks</b></p> <p>Chocolate<br/>         Dried fruits<br/>         Jam<br/>         Pickles</p>  |

**Annex 6.** Example of 24 hours recall table filled in during the field trip on the 2<sup>nd</sup> day of the training (note that the recall refers to a festivity and not to a typical day)

| Breakfast   | Snack   | Lunch  | Snack  | Dinner   | Snack |
|---|---|--|--|--|-------|
| Fried eggs with flux oil, tea with sugar, wheat bread, nuts | Coffee+ sugar, <i>chagaldak</i> (fried wheat dough with potato and onion) | Rice porridge (rice, carrot, pumpkin, potato, onion, tomato, peas, beef meat, oil, coriander, dill all cooked on the wood), tomato juice, plain tea (no sugar), bread, grapes, water | Almonds, nuts, sweet candies, cold tea with sugar, water | Grilled chicken with chili pepper and salt, <i>chagaldak</i> (fried wheat dough, chilli pepper, salt, coriander), tinned cucumber, watermelon, pistachios, apple, grapes, cherry juice, tea, bread (made of milk), cake (layered cake of puff pastry, cream made of eggs, milk, sugar) | Water |

## Annex 7. Pre-training course capacity evaluation surveys per participant

| Full Name               | Name and type of organization              | Position and main responsibilities  | Main areas of work                                 | Main activities related to your role at work   | Percentage of your time dedicated to nutrition        | Provide some examples of activities with specific nutrition outcomes | Are you familiar with the Dietary Diversity Score? | In the context of what activity have you used the DDS? | Food and nutrition security assessment indicator(s) you are familiar with, you have used or you are currently using in your work? | Does your institution provide any training/ staff resources to effectively monitor and assess projects' impact on nutrition? | Relevance of the topics and objectives of this training course in your work? | What capacity (ies) are you expecting to acquire?             | Is/are there any particular topic(s) that you expected to be addressed by this training course and that are not? | Would support in any of the following be helpful to you?  | Any other general comment  |

## **Annex 8.** End-of-training evaluation results (summary of answers from participants)

The End-of- training evaluation was conducted by using questionnaires (see example below) that were distributed to the participants upon completion of the training course.

First part of the questionnaire refers to the overall quality of the training.

The clarity of the objectives as well as the relevance of the presentations were rated as good and above by 91 percent of the respondents. There were 80 percent and 73 percent of the respondents rating good or above to the quality of the material and the quality of the trainers respectively.

Space allocated to discussion and exchange was not enough for half of the respondents. However, positive comments were given to the usefulness of the information and the material, the professional performance of trainers and good practice shown. Several suggestions were given to the content of the training. These are:

1. More time should be dedicated to the analysis of the data using specific statistical analysis packages;
2. More detailed information on the methodology, sampling method and methods for selection of the target groups could be provided;
3. The training material is mainly based on the African countries and is not always compatible with the local reality, e.g. Tajikistan;
4. Some of the presentations, which had to be translated into Tajik and/or Russian, were not easily understandable;
5. More time should be allocated to the activities of the second day, especially households' interviews.

Second part of the questionnaire enquires on how confident participants feel in conducting the different steps of the adaptation of the DDS questionnaire.

At least 91 percent of the respondents feel confident in conducting the different steps for the adaptation and use of the DDS (they rated 4 or above) including adaptation of the DDS to the local context with key informants, classification of collected info into food groups, conduct focus group discussions and 24 hour-recall in household interviews, data analysis and presentation. The respondents considered the analysis method simple and provided the following suggestions:

1. To find out more about food culture prior to visiting the country (e.g. the key informants were asked about hunting on rats, turtles etc.) and;
2. To conduct focus group discussions in a more effective manner.

## Annex 9. End-of-training evaluation questionnaire

| Please rate the overall quality of the training                                 |      |      |      |           |   |
|---|------|------|------|-----------|---|
|   | Weak | Fair | Good | Very good |   |
| Clarity of the objectives of the training                                       |      |      |      |           |   |
