# Criteria and indicators for sustainable woodfuels

Case studies from Brazil, Guyana, Nepal, Philippines and Tanzania

# CRITERIA AND INDICATORS FOR SUSTAINABLE WOODFUELS

Case studies from Brazil, Guyana, Nepal, Philippines and Tanzania

Edited by

Simmone Rose Elizabeth Remedio Miguel A. Trossero

Summary	xi
1. INTRODUCTION	1
Country summaries	2
Conclusions and recommendations	5
2. SUSTAINABLE FUELWOOD PRODUCTION IN BRAZIL	11
Introduction	11
Fuelwood supply and demand	11
Methodological issues	22
Some fundamentals	22
Woodfuel data in Brazil: a critical review	23
Conclusions	28
References	28
3. SUSTAINABLE CHARCOAL PRODUCTION IN BRAZIL	31
<b>5. SUSTAINABLE CHARCOAL FRODUCTION IN BRAZIL</b> Introduction	31
Charcoal supply and demand in Brazil	31
Sustainability and economics of charcoal in Brazil	39
Social and technology aspects	39 41
Charcoal and climate change issues	42
Conclusion and recommendations	43
References	45
	47
4. ANALYSIS OF FUELWOOD PRODUCTION SYSTEMS IN GUYANA	47
Introduction	47
Objectives	48
Firewood production in Guyana	48
Production cycle and statistics Fuelwood markets	48 51
Regulatory requirements	51
Analysis of key aspects	51 52
Socioeconomic, cultural and environmental	52 52
Legal and institutional	53
Conclusions and recommendations	53
Status and impact of firewood production in Guyana	53
Topics for further in-depth studies	53
References	54
5. ANALYSIS OF CHARCOAL PRODUCTION SYSTEMS IN GUYANA	57
Introduction	57
Objectives	58
Background	58
Charcoal production in Guyana	58
Production cycle	58
Location of raw material and production units in Guyana	60
Production statistics	61
Use of charcoal and charcoal markets	62
Analysis of Key Aspects	65
Environmental	65
Institutional and legal	66
Conclusions and recommendations	68
Status and impact of charcoal production in Guyana	68
Topics for further in-depth studies	68

#### Acknowledgments

FAO wishes to thank Miguel Angel Trossero, Senior Forestry Officer, Wood Energy, and Simmone Rose, Forestry Officer, Forestry, Climate Change and Bioenergy, who developed, coordinated, supervised and monitored the work of different experts involved in the prepartion of these case studies.

Special thanks also to all of the experts for their contributions.

#### **Summary**

The International Energy Agency's (IEA) Key World Energy Statistics published in 2008 show that the World Total Final Consumption for Combustible Renewables and Waste stood at 13.2% in 2006 as compared to 13.2% in 1973. This means that after more than 30 years, the reality that biofuels and bioenergy, including woodfuels and fuelwood will remain to be used in the many years to come. Its consumption may yet persist to be traditional in poverty regions, but modernization efforts are rapidly expanding particularly in more developed countries. This is mainly due to the fact that bioenergy resources are still abundant in many areas, it can be locally sourced as it is indigenous, and if managed properly, these resources are environmentally appropriate and sustainable.

According to FAO, woodfuels consist of all types of biofuels originating directly or indirectly from wood biomass that includes fuelwood, charcoal and black liquor (not included in this study). The growing interest in wood energy is leading to a high demand for woodfuels. There is a general concern that increased woodfuel use may cause additional pressure of already dwindling supply sources leading to additional deforestation and devegetation. As such, standards for sustainable management of different supply sources of fuelwood and charcoal are needed to ensure renewable woodfuel production and uses. However, many aspects influencing the different processes and operation units of the production of woodfuels are not yet properly understood, described and quantified.

FAO and IEA Bioenergy Task 31 have developed a project to evaluate criteria and indicators applicable to woodfuel systems to ensure sustainability. This project considered environmental, economic and social criteria, as well as the legal and institutional framework, which can ensure the sustainable production of woodfuels from forests, trees outside forests and other sources. As part of this project case studies were conducted in five developing countries covering three geographical regions. The case studies of Brazil, Guyana, Nepal, Tanzania and Philippines provide essential information to contribute to the elaboration of principles, criteria and indicators for sustainable woodfuels.

The importance and significance of woodfuel production and consumption all over the world particularly among developing countries is huge. The need for a policy framework that will provide sustainability in production and management can no longer be delayed. But are countries ready to establish one? Are data and information available? Is there political will among governments and its citizens so that despite rapid industrialization, a sustainable woodfuel production will continue to be achieved in the years to come? These are some of the questions that these case studies sought to answer. Each country's case is unique from the other yet similar in the way that woodfuels continue to be a traditional source of energy yet data and policies are wanting. And despite these circumstances, there is much evidence to show that woodfuels particularly charcoal and fuelwood production, consumption, and trade do have tremendous socioeconomic and environmental impact in all these countries.
