
 ISOLATION OF  
*Fusarium oxysporum f. sp. cubense*:  
OBTAINING SINGLE SPORE CULTURES

 Culture media more frequently used

Carnation Leaf Agar (CLA)  
(Natural medium)

Procedure:

- 1) Leaf of non-treated (with pesticides) carnation plants are harvested and cut in fragments of 5-8 mm.
- 2) Leaf are dried in a oven at 70° C for 3-4 hours until they become fragile
- 3) Sterilize in plates or bags by gamma irradiation at 2.5 megarads.
- 4) Place sterile carnation leaf fragments in Petri plates of 2% (20 g/L) of water agar. (Five per plates).
- 5) Conidia were produced in 7-10 days. Very important for diagnosis based in morphological features. Allow store cultures by a year.

---

 Preparation of Carnation Leaf Agar

 1  
Carnation leaf fragments of 5-8 mm

 2  
Dry at 70°C for 3-4 hours

 3  
Sterilization by gamma irradiation at 2.5 megarads

---

---

---

---

---

---

---

**Preparation of Carnation Leaf Agar**

1 Biological safety cabinet

2 Water agar 2% poured in plates

3 Sterilized Carnation leaf fragments placed in plates and tubes

4 Plates and tubes with sterilized Carnation leaf fragments ready for inoculation

**Culture media more frequently used**

Water Agar		Modified Komada medium (K2) (Su <i>et al.</i> , 1978)	
✓ Agar	20g	• D-Galactose	10.0 g
✓ Distilled water	until 1 L	• L-Asparagine	2.0 g
Autoclave at 121 °C for 20 min. Recommend for isolation.		• KH <sub>2</sub> PO <sub>4</sub>	1.0 g
		• KCl	0.5 g
		• MgSO <sub>4</sub> ·7H <sub>2</sub> O	0.5 g
		• FeNa EDTA	10.0 mg
		• Agar	20.0 g
		• Distilled water	900 mL
		Adjust pH to 3.8 with 10% of phosphoric acid. Add 100 mL of filtration sterilized solution (≈ 50°C) of :	
		1. Streptomycin Sulphate	0.3 g .
		2. Oxgall	0.5 g
		3. N <sub>2</sub> B <sub>4</sub> O <sub>7</sub>	0.5 g
		4. PCNB (75% PH)	0.9 g
		Plates are inoculated with a 0.5 ml diluted soil suspension.	

Agar papa dextrosa (PDA)	
• Potatoes (peel)	200 g
• Dextrose	20 g
• Agar	20g
• Distilled water	until 1 L.
Recommended to establish grown rate, colony morphology and pigmentation.	
Not recommended for morphological characterization or strain conservation for further studies.

**Culture media more frequently used**

Carrot Agar		Agar Spezieller Nährstoffarmer (SNA).	
• Carrots (peel and washed)	400 g	• KH <sub>2</sub> PO <sub>4</sub>	1 g
• Distilled water	500 ml	• KNO <sub>3</sub>	1 g
1) Boil for 1 hour in distilled water.		• MgSO <sub>4</sub> ·7H <sub>2</sub> O	0.5 g
• Homogenize in a blender		• KCl	0.5 g
• Filter through fine sieve		• Glucosa	0.2 g
• Add distilled water	500 mL	• Sacarosa	0.2 g
• Agar	20g	• H <sub>2</sub> O destilada	1L
2) Autoclave at 121 °C for 20 min. (very important in order to destroid resistant spores).		If pieces of Whatman # 1 filter paper are added, sporulation are stimulate.	
3) Pour abundantly (15-17 mL for plates with 60 mm diameter) because incubation period can reach six weeks		Recommended to achieve a stable conidial production and chlamyospore formation.	
Recommended for sexual crosses in order to generate teleomorph state

### Isolation of *Foc*.

- ✓ Isolations were made when vascular strands were dry.
- ✓ Place small sections 3-6 mm of discolored vascular strand in Water Agar, weak PDA (25% strength) + streptomycin sulphate (100 ppm); or in K2 medium
- ✓ Colonies shows up in a period of 2-4 days.

---

---

---

---

### Single spore culture through striated

1. Isolation from plant material  

Water Agar, PDA with streptomycin or K2 media  
2-4 days

If plates are not contaminated, conidial suspension can be prepared directly from Fusarium grown in isolation plate.
2. Subculture small areas of Fusarium colony in PDA + Streptomycin.
3. Striate conidia suspension in Water Agar  

Agar cube with a single spore
4. After 24 hours, transfer at least two germinated spore to PDA + streptomycin.
