# Data ... information ...

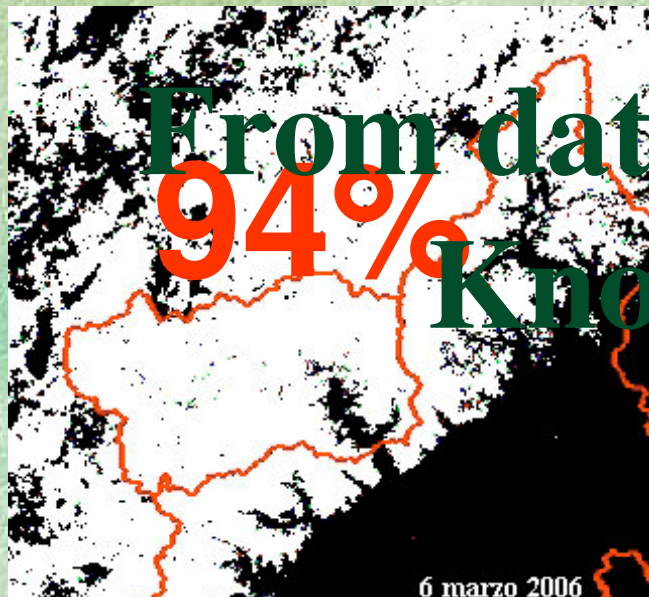

**datum** : element of information represented by symbols/values to be elaborated/interpreted

**information** : any aggregation of data the meaning of which is known (besides its values)

# Data ... information ...

## Classification of snow covered pixels in Valle d'Aosta (white pixels=snow; black pixels=no snow)

**2006**  
percentage of VdA surface covered by snow = **94%**  
corresponding area = 3081 km<sup>2</sup>

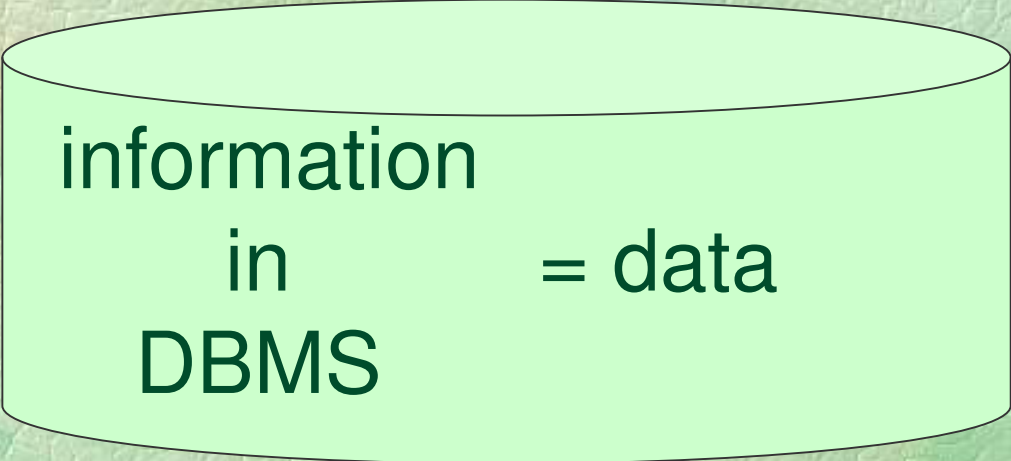

**2007**  
percentage of VdA surface covered by snow = **60.3%**  
corresponding area = 1977 km<sup>2</sup>

From data to information ...  
**Knowledge increase**

# IT systems for data management

In data base management systems information is represented in a basic way through data

information  
in DBMS = data

they need interpretation to enrich knowledge

# IT systems for data management

## In DBMS

data, codified facts:

Claudio Massimo Colombo  
24/12/1959  
0874404654  
AGR/14 PEDOLOGIA  
Scienza del suolo applicata

## Knowledge

requirements:

Who teaches in the course 'Scienza del suolo applicata'?  
Which is his phone number?  
Is there somebody who is expert in pedology at the University of Molise?  
.....

data must be interpreted to enrich knowledge

# IT systems for data management

## DBMS :

to manage increasing amount of data related to traditional enterprise/organization applications

[database is a structured collection of records or data that is stored in a computer so that a computer program can consult it to answer queries]

From the 1960's

Applications: electronic catalogs, ticket reservation systems, bank account management systems, etc. etc.

# IT systems for data management

IRS (Information Retrieval System) :

to manage great amount of books, papers, texts ... in general unstructured documents (also images)

From the 1960's

Applications: electronic catalogs, library management, etc. etc., search engines on the WWW (also to search locations)

# IT systems for data management

In IRS

document surrogates:

Ulysses James Joice 1922  
Odyssey Homer 8th-7th century BC  
Ulysses Alfred Tennyson 1842  
.....

Ulysses  
blabla  
blabla  
blabla  
blabla  
blabla  
....

Knowledge

requirements:

Books titled 'Ulysses'?  
Books published after 1900?  
Books about 'troy' and 'ithaca'?  
.....

# IT systems for data management

GIS (Geographic Information System) :  
to manage archives of geographic data, i.e. data with a  
spatial extent and a geographic reference  
and to allow their analysis

From the 1960's

Applications: cartography, environmental applications, risk  
evaluation, simulation and scenarios building, demography,  
resource location systems, land/urban planning,  
archaeology, tourism, etc. etc. etc.

# IT systems for data management

## **Main data sources**

- ☛ Topographic Mapping: national/regional agencies and private companies
- ☛ Military organizations (IGM)
- ☛ Space agencies (NASA, ESA, ASI)
- ☛ Environmental agencies (geology, hidrology, geography, pedology, biology, climatology, etc.)

## **Main data types**

- ☛ Topographic Maps at various scales (1:100.000, 1:50.000, 1:25.000)
- ☛ Thematic Maps (Fogli CARG 1:25.000)
- ☛ Remotely sensed images (e.g. LANDSAT, orthophotos)
- ☛ Administrative and infrastructure maps
- ☛ Measures of environmental, historical, sociological, demographic ... parameters

# IT systems for data management

In GIS

data (DBMS) + coordinates + spatial representation

Germany Berlin 78.5 contour1

France Paris 58 contour7

.....

Roads\_of\_france theme3

.....

Alps land\_cover\_6

.....

To meet knowledge requirements including geographic constraints!

Hotels next to a train station in the Northern area of Rome

Italian regions where forests cover more than 50% of surface

Percentage of forest fires that originated next to a road .....

# GIS

A GIS is a program able to capture, store, analyse and visually represent information with a geographic reference

Data with spatial reference and a spatial representation

- ☞ co-ordinates  $x, y (z) (t)$
- ☞ spatial reference system

# GIS - components

- ☞ **Data Input**
- ☞ **Database Management System** for data representation, storage and retrieval
- ☞ **Data Output** and presentation
- ☞ **Data Transformation** (update, modification, analysis) e.g.: scale conversion, re-projection, evaluation of feature values, fusion, etc
- ☞ **Interaction** with the user (user interface)

Attributes

Position and  
extension

Topology

# GIS - examples of information

Information : road network in the region X  
Data representation : graph of roads that are geometrically described as lines  
it's a digital image

Information : hydrography of the region X  
Data representation : graph of rivers/lakes that are geometrically described as either lines or polygons  
it's a digital image

# GIS - examples of information

Information : elevation of the region X  
Data representation : graph of isohypses described as contours of lines following points whose elevation is constant  
it's a digital image

Information : elevation of the region X  
Data representation : grid of cells whose third co-ordinate is the (re-scaled) value of elevation  
it's a digital image

# GIS - examples of information

Information : map of the region X  
Data representation : grid of cells  
whose values are colours  
corresponding to an item of a  
legend.

The source of the digital image is a  
paper map scanned and rectified

Information : geologic map of the region X  
Data representation : polygons associated to  
values corresponding to an item of a legend  
it's a digital image

# GIS - examples of information

Information : radiation emitted by the region X in the visible spectrum

Data representation : grid of cells whose third co-ordinate is the (re-scaled) value of radiance from the cell

The source of the digital image is a sensor on a satellite

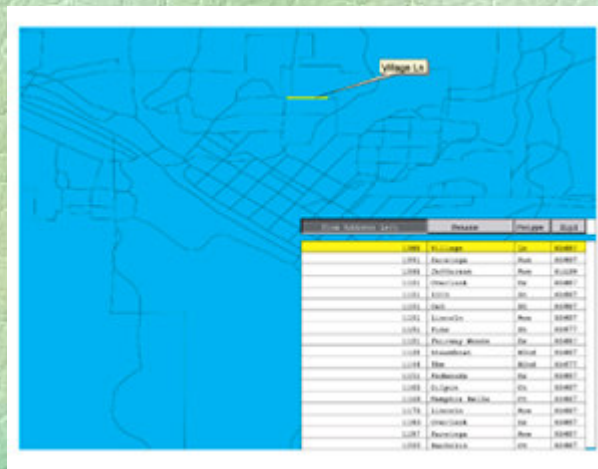

Information : land use in the region X

Data representation : grid of cells whose values are colours corresponding to an item of a legend

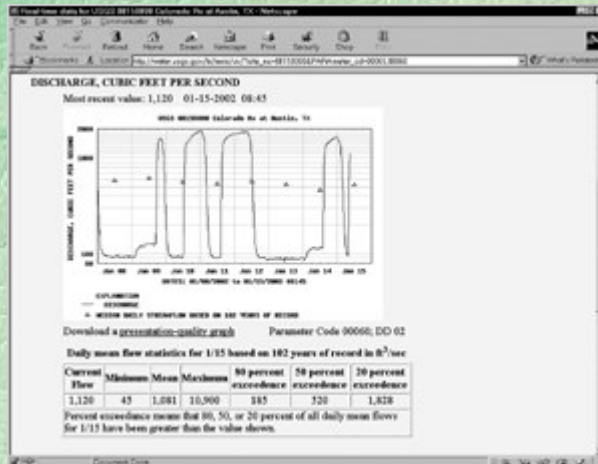

The source of the digital image is the above satellite image

# GIS - examples of information

Information : ownership of land parcels in the region X

Data representation : digital image with the polygons associated to each parcel + table of data; each record contains the data regarding a polygon

Information : runoff trend of the main river in the region X

Data representation : graph of the river runoff at a gauging station (runoff values at a known location along time)

# GIS - relating information

A GIS relates what is present in its stored data :  
maps (layers) are connected each other through the coordinate association  
-> ex. if we select an area in the cartography layer, we can know ... its geologic composition (geology layer) ...

# GIS - relating information

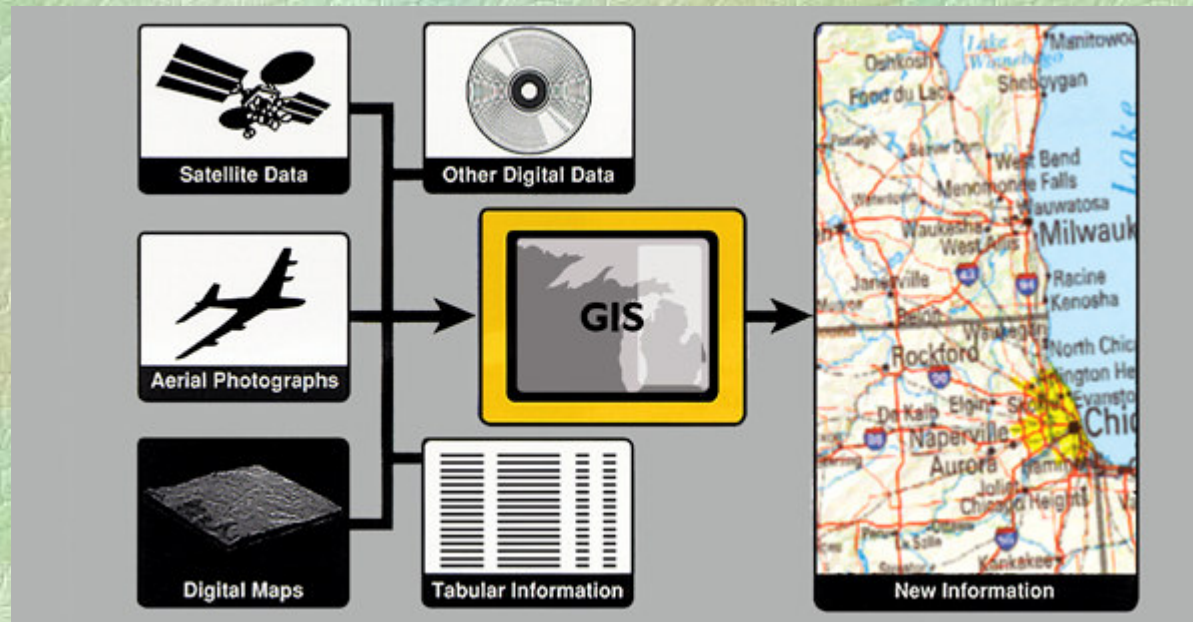

... its elevation ...

... its hydrography ...

... and control its present use through the satellite

# GIS - a tool to integrate information

A GIS is a powerful tool to connect heterogeneous data related to the same area to create new knowledge that can be expressed as results of queries, maps, graphs, ...

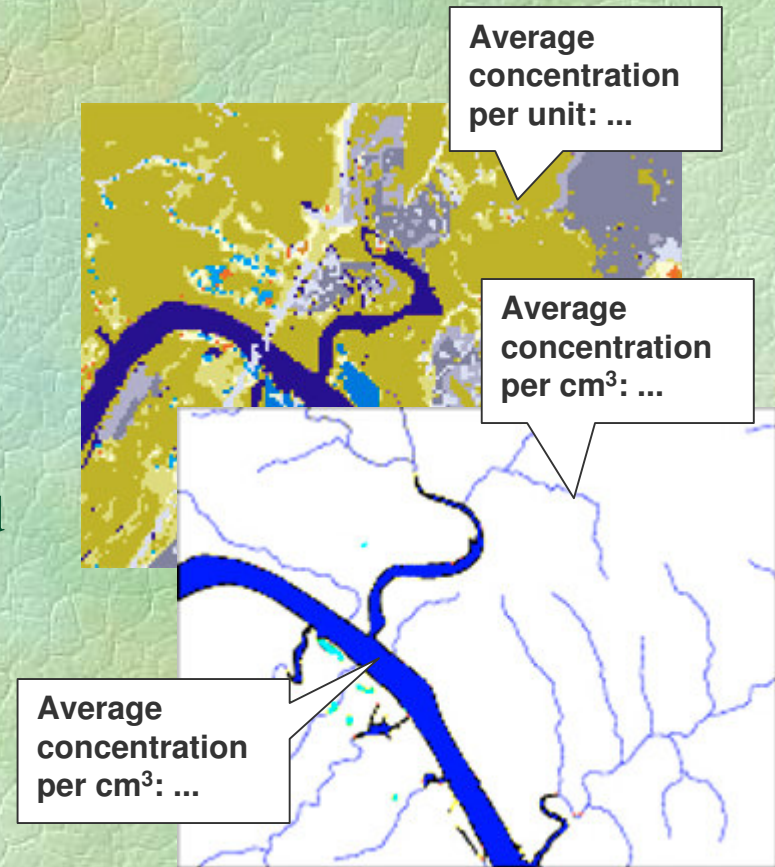

# GIS - a tool to integrate information

A simple example for prediction purpose

A GIS can enrich data on land use storing the amount of fertilizer used in each field unit

The spatial intersection of land use with hydrography allow to find intersections of field units and rivers

A suitable model can compute the amount of nutrients carried by each river and their total amount in the main streams

# GIS - a tool to generate new information

Source of data: values measured by field sampling in an area of interest

A GIS is able to generate polygons whose contours border areas where measured values are constant. The result is a new layer where each contour highlights a change in the value. Value distribution can be done through different methods based on different models.

The new layer can be stored and used for further analysis ...

# GIS - a tool to generate new information

GIS allow analysis requiring to verify

- adjacency (what is next to x?)
- inclusion (what is inside y?)
- proximity (which is the distance of x and y?)

Some examples of queries:

- Are there stables next to the spring?
- Are there roads whose distance from the spring is no more than 1 km?

A GIS is able to generate maps that visually emphasise metric and topologic relations

# GIS - a tool to integrate information

Complex examples:  
see further slides

# GIS - data are an issue

Data in a GIS must be ‘comparable’

Projection: geometric method to transfer 3D on the surface of Earth (which is not flat) to a 2D representation.

Different methods are available and the choice depends on purpose, conventions, ... (ex: a projection preserving shapes does not preserve distances)

Operative GISs have facilities to change projections

# GIS - data are an issue

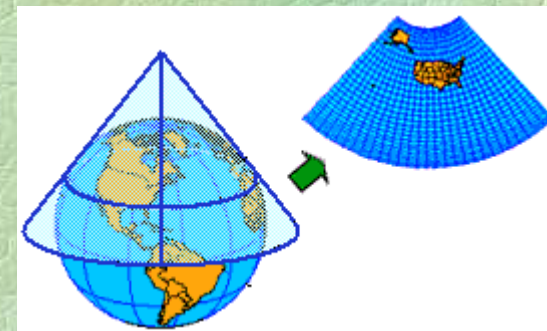

## Cylindrical Projection

## Planar Projection

## Conical Projection

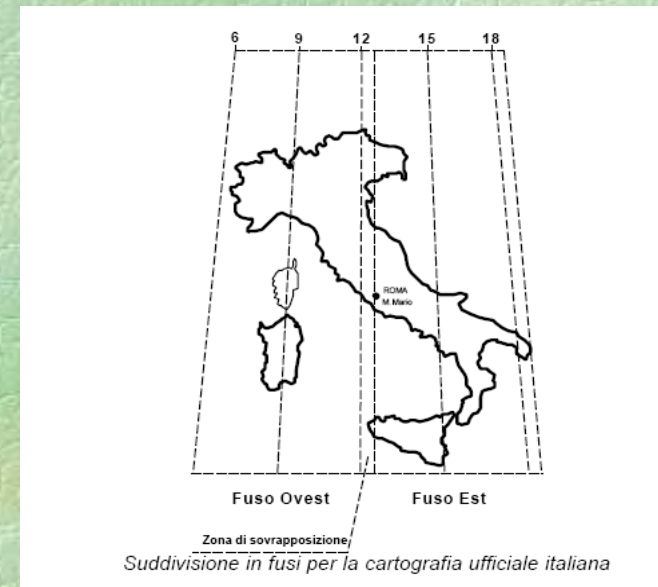

# GIS - data are an issue

Official Italian cartography adopts the system **Gauss-Boaga** (since 1940) with two time zones:

- West time zone and East time zone next to the time zones 32 and 33 UTM (Universal Transverse Mercator) ( $9^\circ$  and  $15^\circ$  east long)
- local meridian Monte Mario, Rome

Note tratte da:

**Regione Piemonte**  
Manuale della Carta  
Tecnica Regionale Numerica

# GIS - other data issues

## Co-ordinates

A spheric co-ordinate system is used to locate and measure geographic objects on the Earth

Co-ordinates are expressed as degrees of latitude and longitude. Values are either positive or negative

Measures are in degrees, minutes and seconds (DMS) or in decimal degrees (DD). By example  $55^{\circ}30'00''$  is the same value of  $55.5^{\circ}$

The EC suggest ETRS89 coordinate reference system has established itself as a pan-European system

**<http://crs.bkg.bund.de/crs-eu>**

# GIS - data are an issue

Sometimes geometry prevents  
understanding:  
**the cartograms**

# GIS - cartograms

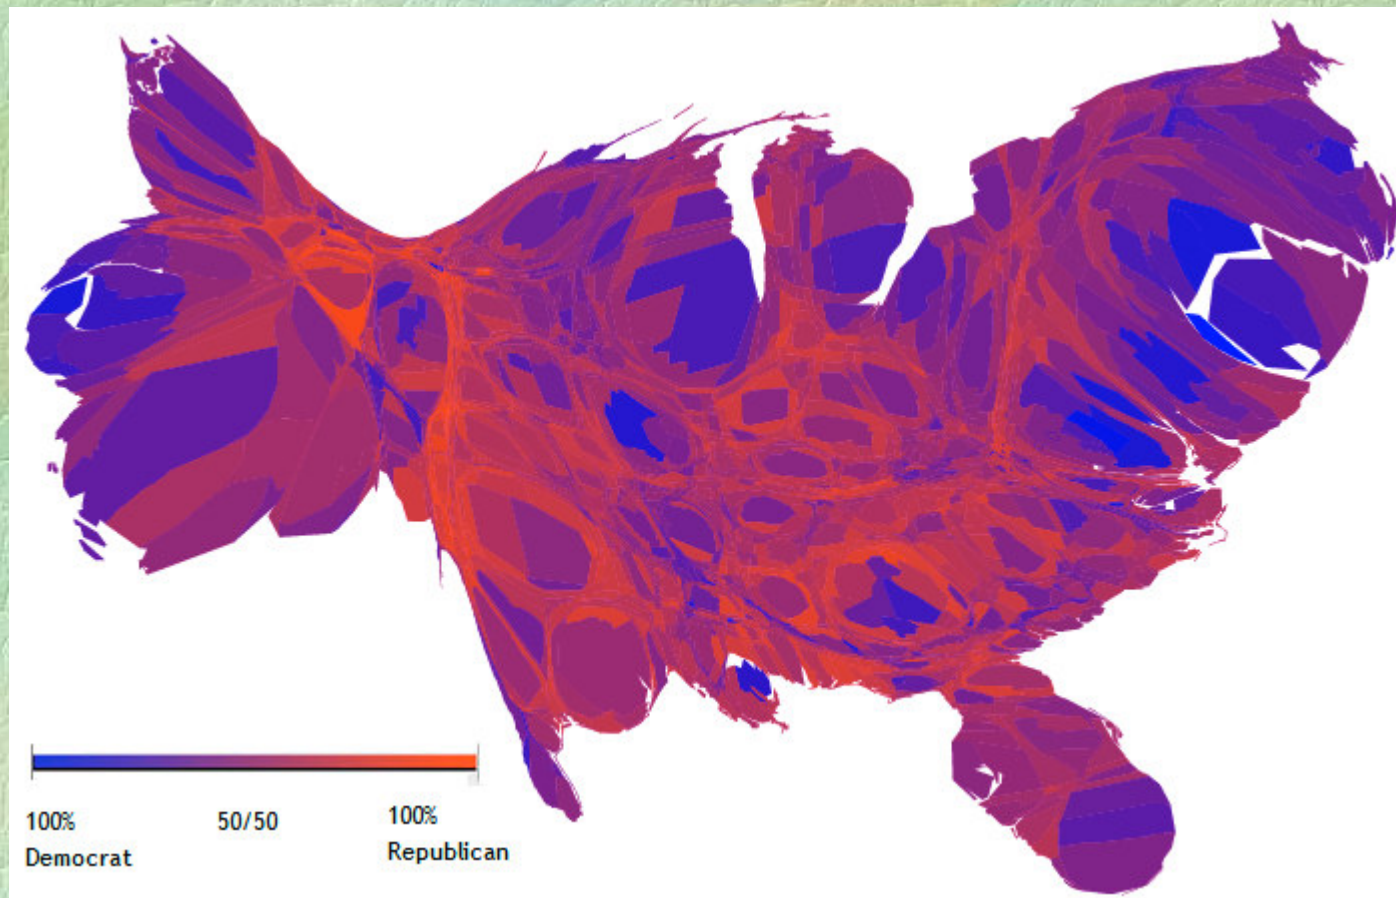

A cartogram is a map in which area is not preserved. Instead, another thematic mapping variable like travel time or Gross National Product is substituted for land area. In other words, the geometry or space of the map is distorted in order to convey the information of this alternate variable. There are two main types of cartograms: area and distance cartograms. An area cartogram is sometimes referred to as a value-by-area map or an isodemographic map. The latter particularly for a population cartogram, which illustrates the relative sizes of the populations of the countries of the world by scaling the area of each country in proportion to its population; the shape and relative location of each country is retained to as large an extent as possible, but inevitably a large amount of distortion results.

# GIS - cartograms

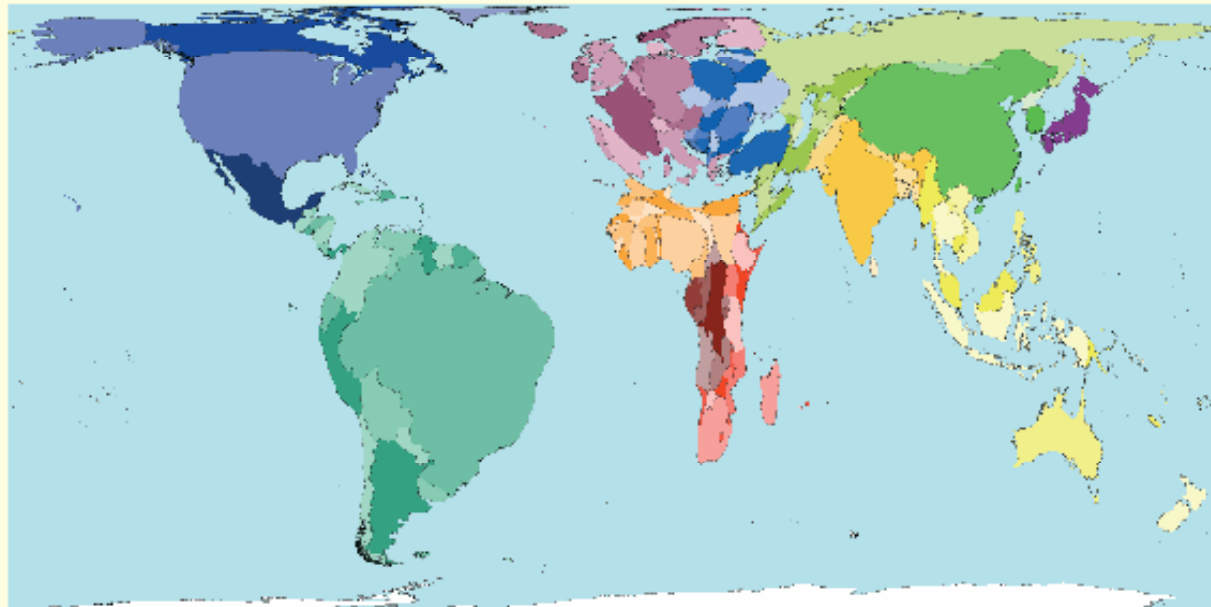

A cartogram depicting popular votes in the 2004 US Presidential election, in which the sizes of counties have been rescaled according to their population.

Created by Michael Gastner, Cosma Shalizi, and Mark Newman of the University of Michigan.

# Biocapacity

Biocapacity measures how biologically productive land is. It is measured in 'global hectares': a hectare with the world average biocapacity. Biologically productive land includes cropland, pasture, forests and fisheries. 16% of the world's biocapacity is in Brazil.

The biocapacity of a territory is affected by physical conditions and people's actions. A pertinent example of this is Iraq, the Mesopotamian marshes were once part of the fertile crescent. Much of this marshland has been drained and become desert. Trade sanctions and social upheavals also reduce people's ability to use land productively. Iraq's land is now estimated to be the least productive in the world.

Territory size shows the proportion of all biocapacity that is found there.

Land area

#### Technical notes

- Data are from the WWF (Worldwide Fund for Nature) International and Institute of Zoology
- \*Biocapacity is measured in global hectares. One global hectare is an area that has the world average biological productivity of one hectare.
- See website for further information.

#### HIGHEST AND LOWEST BIOCAPACITY

Rank	Territory	Value	Rank	Territory	Value
1	Malta	699	191	Botswana	14.4
2	Mauritius	687	192	Mali	13.1
3	Germany	429	193	Afghanistan	11.2
4	Denmark	427	194	Niger	11.1
5	United Kingdom	403	195	Somalia	11.0
6	Luxembourg	378	196	Saudi Arabia	10.5
6	Belgium	378	197	Namibia	10.5
8	Czech Republic	362	198	Algeria	8.3
9	Netherlands	357	199	Libyan Arab Jamahiriya	3.1
10	France	351	200	Iraq	1.8

biocapacity in global hectares per 100 hectares, 2002\*

#### TOTAL BIOCAPACITY

*"... land is 'not only' the ground, it is 'not only' a means of production and it is 'not only' the material reality that one knows ..."*

Claudia Briones, 2006

# Forest Loss

Produced by the SASI group (Sheffield) and Mark Newman (Michigan)

If the net forest loss of all territories between 1990 and 2000 is summed, 31% occurred in South America, and 21% was in Asia Pacific. Worldwide, territories with net forest loss lost 1.33 million km<sup>2</sup> of forest over this ten year period. Despite this, South America was the region with the largest forested area in the world in 2000. The more forest area there is, the more it is possible to lose.

Japan is unexceptional, having neither forest loss nor forest growth from 1990 to 2000.

The area of Africa covered by forest was reduced by 550 000 km<sup>2</sup> in the 1990s. This includes the loss of forests that covered 11.4% of Zambian land.

Territory size shows the proportion of worldwide net forest loss that occurred there between 1990 and 2000.

Land area

#### Technical notes

- Data are from the World Bank's World Development Indicators.
- Forest loss is the change in forest area between 1990 and 2000.
- Forest area is area under natural or planted stands of trees, whether productive or not.
- \*The graph shows net forest loss in each region.
- See website for further information.

#### MOST FOREST LOSS

Rank	Territory	Value	Rank	Territory	Value
1	Belize	15.6	11	Malawi	7.5
2	Zambia	11.4	12	Indonesia	7.2
3	Nicaragua	9.7	13	Malaysia	7.2
4	Samoa	8.8	14	Panama	7.0
5	Cote d'Ivoire	8.3	15	Benin	6.3
6	Zimbabwe	8.3	16	Rwanda	6.1
7	Saint Lucia	8.2	17	Burundi	5.7
8	Liberia	7.9	18	Nepal	5.5
9	Myanmar	7.9	19	Sri Lanka	5.4
10	Guinea-Bissau	7.7	20	Dominica	5.3

forest loss as a percentage of land area

#### WORLD FOREST LOSS DISTRIBUTION\*

*“Indonesia is blessed with some of the most extensive and biologically diverse tropical forests in the world. But the tragedy is that Indonesia has one of the highest rates of tropical forest loss in the world.”* E.G. Togu Manurung, 2006

# Forest Growth

The territory with the most forest expansion between 1990 and 2000 was China, which gained 181 000 km<sup>2</sup> over the ten year period. China is also the territory with the largest population living there. The forest growth in the United States was the second largest increase, but this was only a fraction of the increase in China, at 39 000 km<sup>2</sup>.

Unsurprisingly the most absolute forest growth has occurred in the large territories mentioned above. However the biggest increases in forest as a percentage of land area were in smaller territories such as Cape Verde, Liechtenstein and Portugal.

Worldwide there is net forest loss.

Territory size shows the proportion of worldwide net forest growth that occurred there between 1990 and 2000.

Land area

### Technical notes

- Data are from the World Bank's World Development Indicators.
- Forest growth is the change in forest area between 1990 and 2000. Forest area is area under natural or planted stands of trees, whether productive or not.
- \*Graph shows net forest growth in that region.
- \*\*Hong Kong and Taiwan rank 15th, these were estimated values so are not shown in the table.
- See website for further information.

### MOST FOREST GROWTH

Rank	Territory	Value	Rank	Territory	Value
1	Cape Verde	12.41	11	Israel	2.30
2	Liechtenstein	6.25	12	China	1.94
3	Portugal	6.23	13	Bulgaria	1.84
4	Cyprus	5.74	14	Spain	1.72
5	Gambia	4.50	17	Viet Nam	1.59
6	Swaziland	3.37	18	New Zealand	1.46
7	Uruguay	2.86	19	Bangladesh	1.27
8	Cuba	2.52	20	France	1.12
9	Ireland	2.47	21	Switzerland	1.09
10	Greece	2.33	22	Norway	1.01

forest growth as percentage of land area\*\*

### WORLD FOREST GROWTH DISTRIBUTION\*

*“One generation plants the trees; another gets the shade.”* Chinese proverb, date unknown

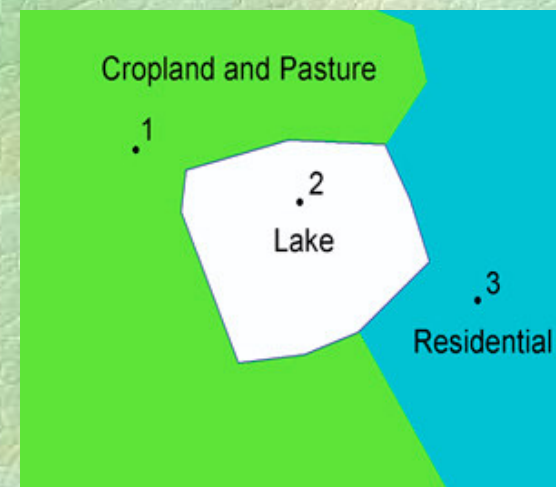

# GIS - other data issues

**Data model : the space  $\mathcal{R}^2$  must be represented in a discrete way.**

geographic areas can be represented as a regular grid (**raster model**). This representation is suitable for operations between images but makes harder spatial transformations (scale, rotations, ..) and contour detection. Raster images may require huge memory space

On the other hand, the **vector model** represent geographic pieces of reality as geometric elements (points, lines, polygons) Vector images are suitable for spatial transformations and contours are well defined. Vector repres. is concise

1	1	1	1	1	1	1	3	3	3
1	1	1	1	1	1	1	3	3	3
1	1	1	1	1	1	3	3	3	3
1	1	1	2	2	2	2	3	3	3
1	1	1	2	2	2	2	3	3	3
1	1	1	2	2	2	2	3	3	3
1	1	1	1	2	2	2	3	3	3
1	1	1	1	1	1	3	3	3	3
1	1	1	1	1	1	1	3	3	3
1	1	1	1	1	1	1	1	3	3

# GIS - other data issues

## Data model is guided by:

- Data source (e.g. RS images)
- Objects are discrete, simple, punctual, extended, composed, interconnected, ...
- Variation of attributes is continuous ..

## NB:

- Scale!!!
- Purpose, application, operations

How do we conceptualize reality?

What are our perceptions of the world around us?

# Spatial data on WWW

**Web mapping** designs, implements, generates, delivers and shares maps on the WWW (PCs, PDAs, mobile phones, ..)  
ex. Google Earth

If the (mobile) web maps also display context and location sensitive information, such as points of interest, the term **location based services** is frequently used

In **WebGISs** it is possible to analyse, process, elaborate geodata via the WWW

Web mapping open new perspectives in distributing and sharing geographic data (up to date info, no intermediaries, ...)

many new issues (technological/conceptual/legal)

# Spatial data on WWW

new issues

technological: image dimensions, screen space and resolution, bandwidth, interaction, reliability of the network, immature development tools, ...

conceptual: data model, modelling/representation standards, reference systems, co-ordinates, usability, accuracy/quality, ...

legal: copyright, security, privacy, ...

**Spatial Data Infrastructure (SDI)**

# IDE UNIVERS

## What is an Infrastructure?

- It's a net of interconnected elements supporting some activity, e.g. social or political, urban, economic, military, ...
- It aims at enabling the flow of goods, people, services, etc.
- It needs organisations in charge of its planning and implementation
- It requires previous and long-term investment of costs, engagements, and maintenance

# IDE UNIVERS

## Example: road infrastructure

**Technologies:** building of the road network

**Strategies:** planning and maintenance at multiple levels (local, regional, ...)

**Standards:** system of signals, code of signals, road information, ...

**Guarantee access to the road network**

**Optimize capacities of available networks**

**Guarantee efficiency and safety of roads**

# IDE UNIVERS

## Spatial data sharing: an important activity

**Geographic information is fundamental in many important fields of human/social activities** because information must be accessible, owner must be easily identified,

- ❖ Environment management and
- ❖ Security and logistics
- ❖ Social and health d
- ❖ Service imp
- ❖ ...

cost (if any) must be clear,

characteristics must be transparently evaluated,

suitability to the user management process must be analysed,

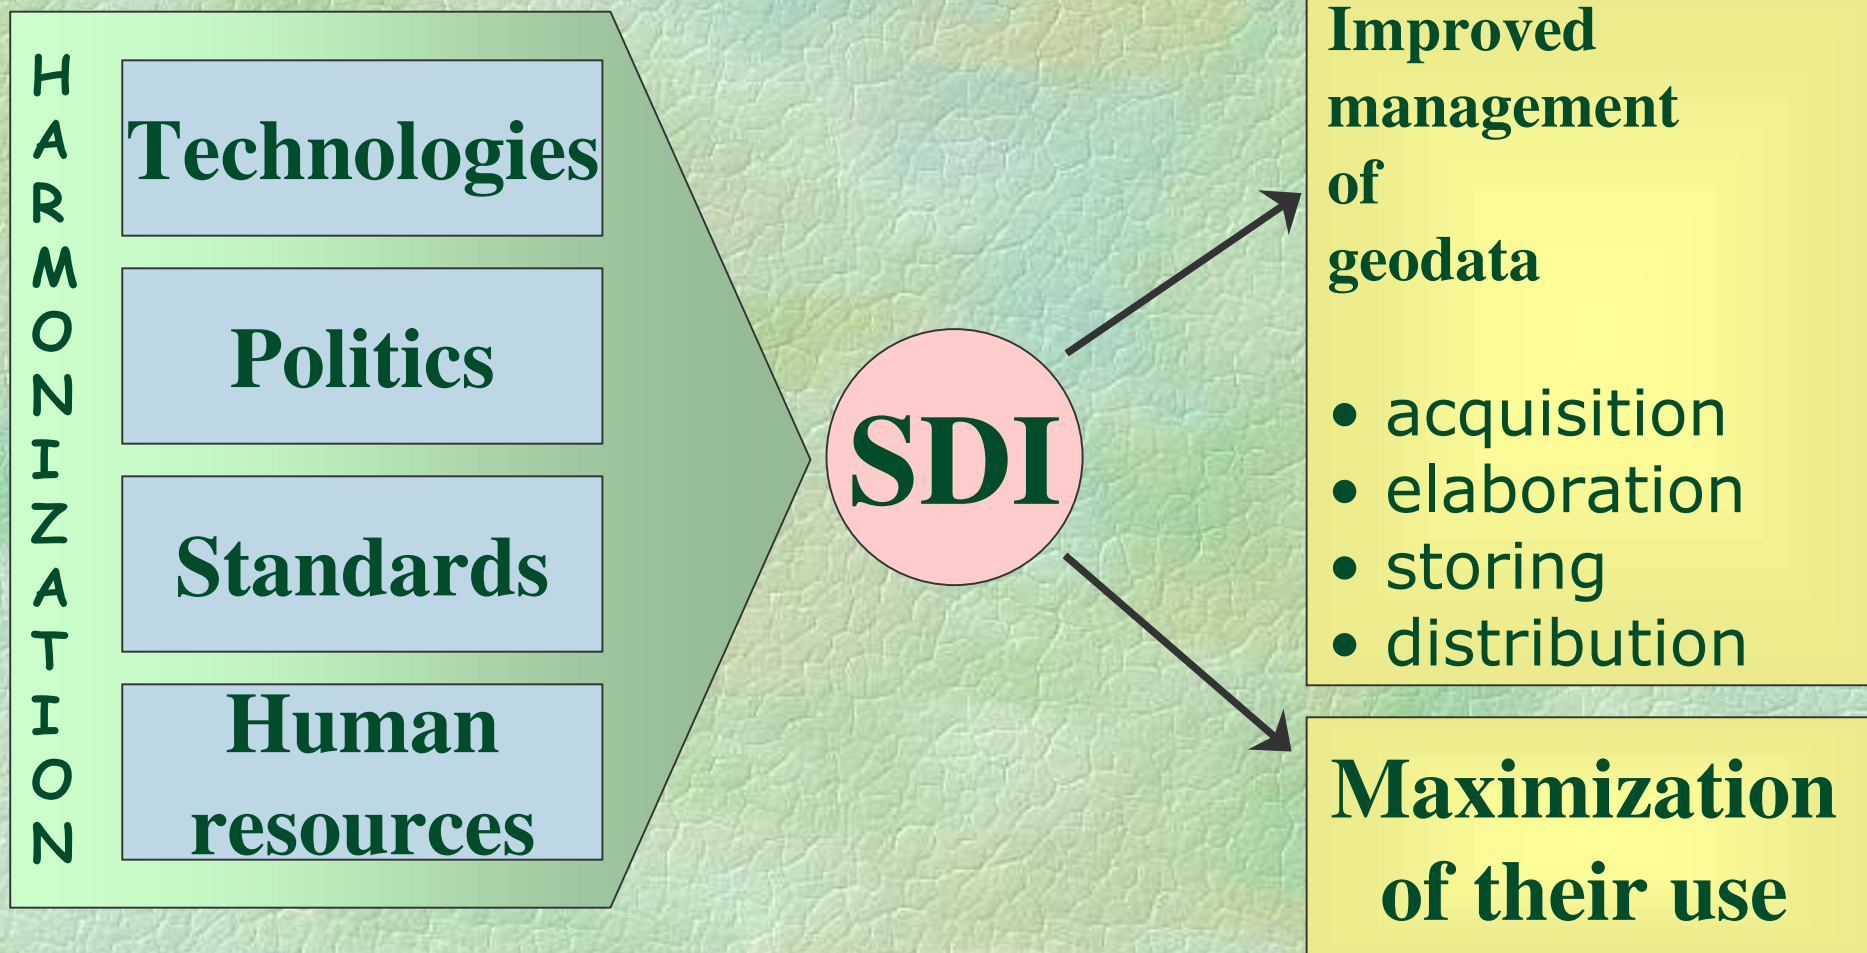

....

**We need an infrastructure**

## Spatial Data Infrastructure (SDI) -framework-

# IDE UNIVERS

## SDI in Europe: INSPIRE Initiative

**INSPIRE** (Infrastructure for Spatial Information in Europe) was put forward by the European Commission in 2004 to promote and develop an European SDI. The objective is to improve the planning and implementation of Community policies in areas such as the **environment, transport, energy and agriculture**. This should lead to better understanding of problems such as floods or air and water pollution, which recognise no national borders.

Parliament and the Council struck a deal (approved on November 21st, 2006) which will enable data to be shared across the EU, without undermining high quality services in the Member States.

# INSPIRE objectives

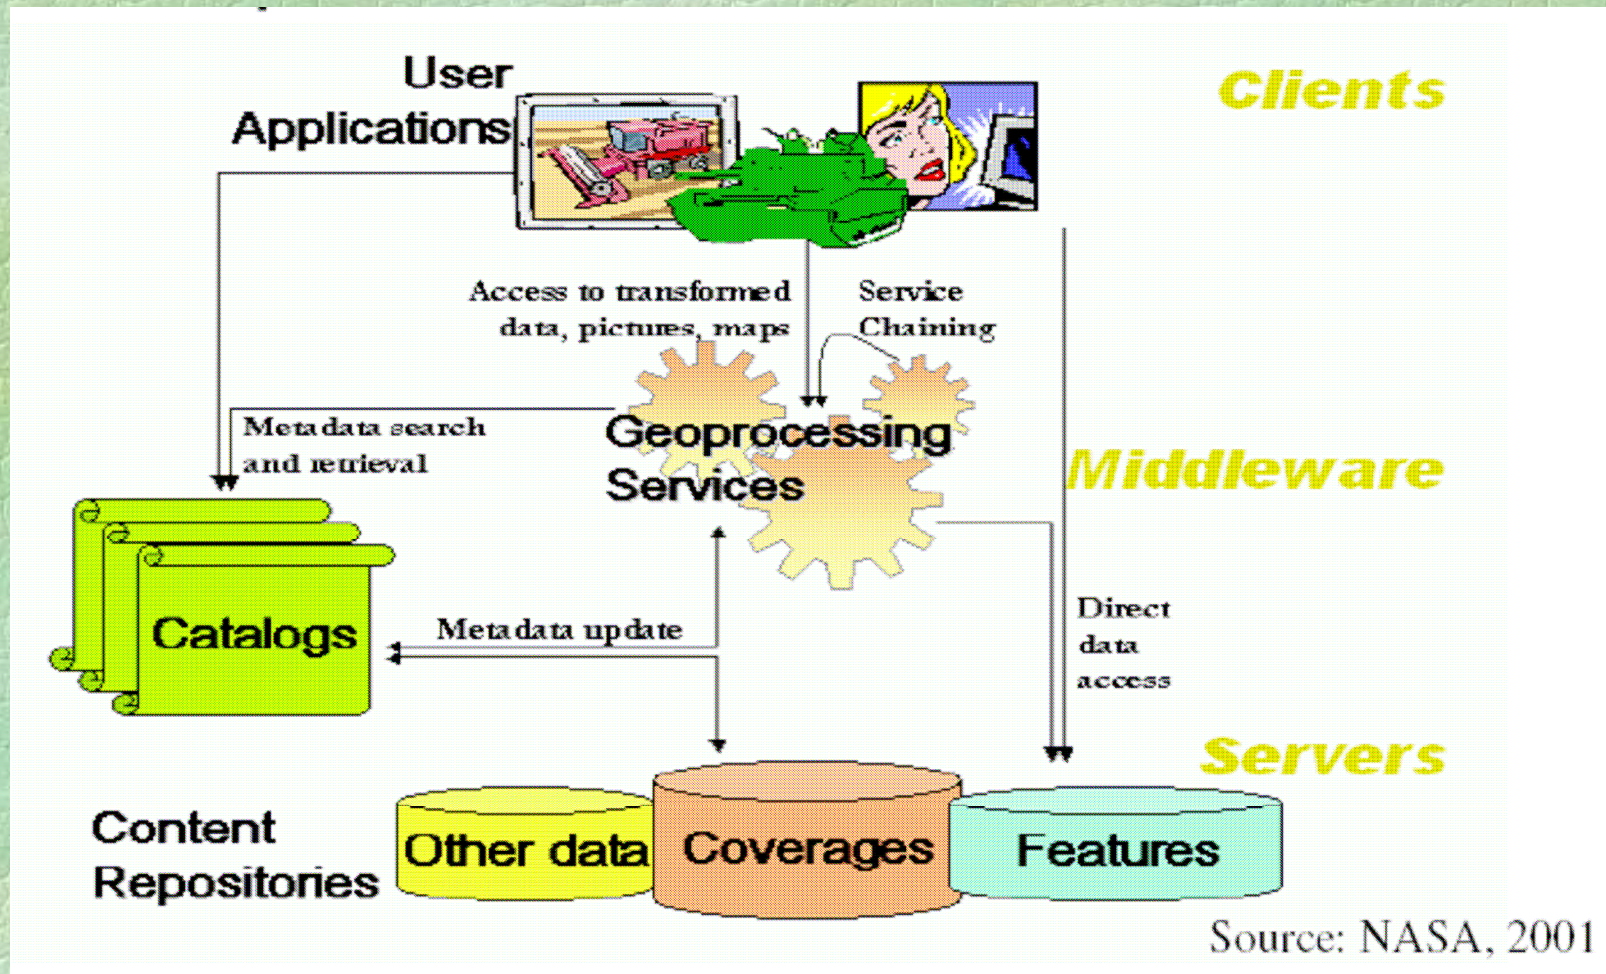

**Make relevant, harmonised spatial data available for Community Environmental Policy (formulation, implementation, monitoring and evaluation) and for the citizen ...**

**... through the establishment of integrated spatial information services, based upon a distributed network of databases, linked by common standards and protocols to ensure compatibility.**

# INSPIRE architecture

# IDE UNIVERS

- Available studies?
- Pedology?
- Hydro network?
- Local areas main troubles?
- Pollution?
- Landslide risk?
- Social composition?
- Available long-term data series?
- Some previous report on the same topic?
- Contacts?

**Example:**  
 Place: Morbegno (SO)  
 Lat: 46.10 - 46.15 N  
 Long: 9.55 - 9.63 E

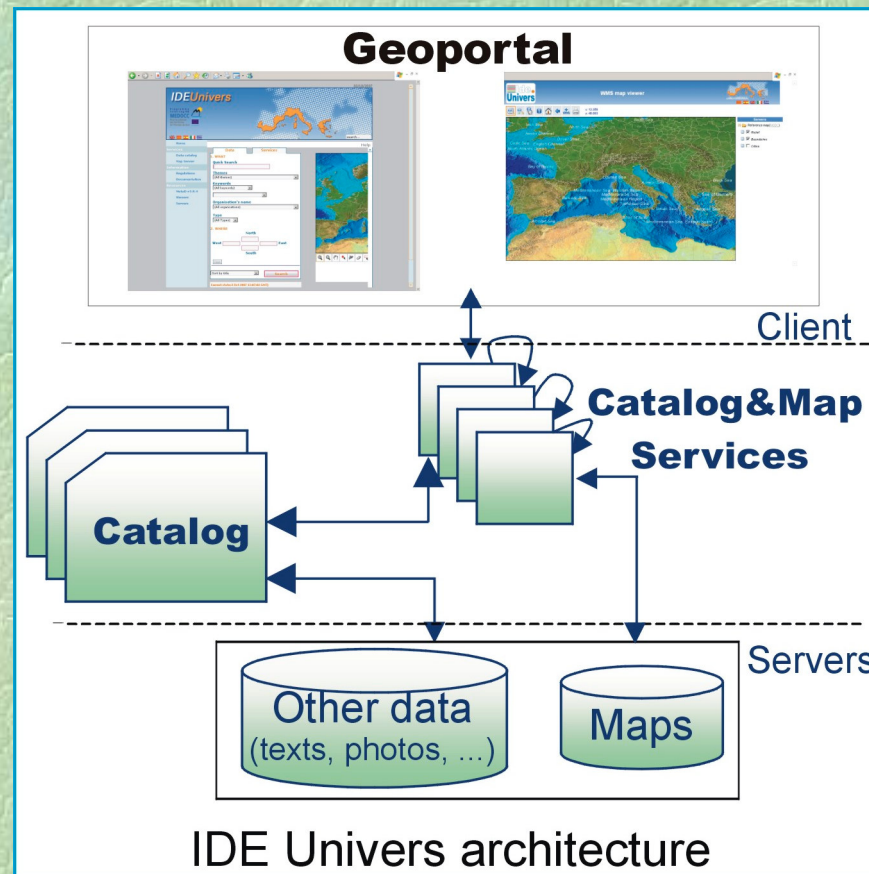

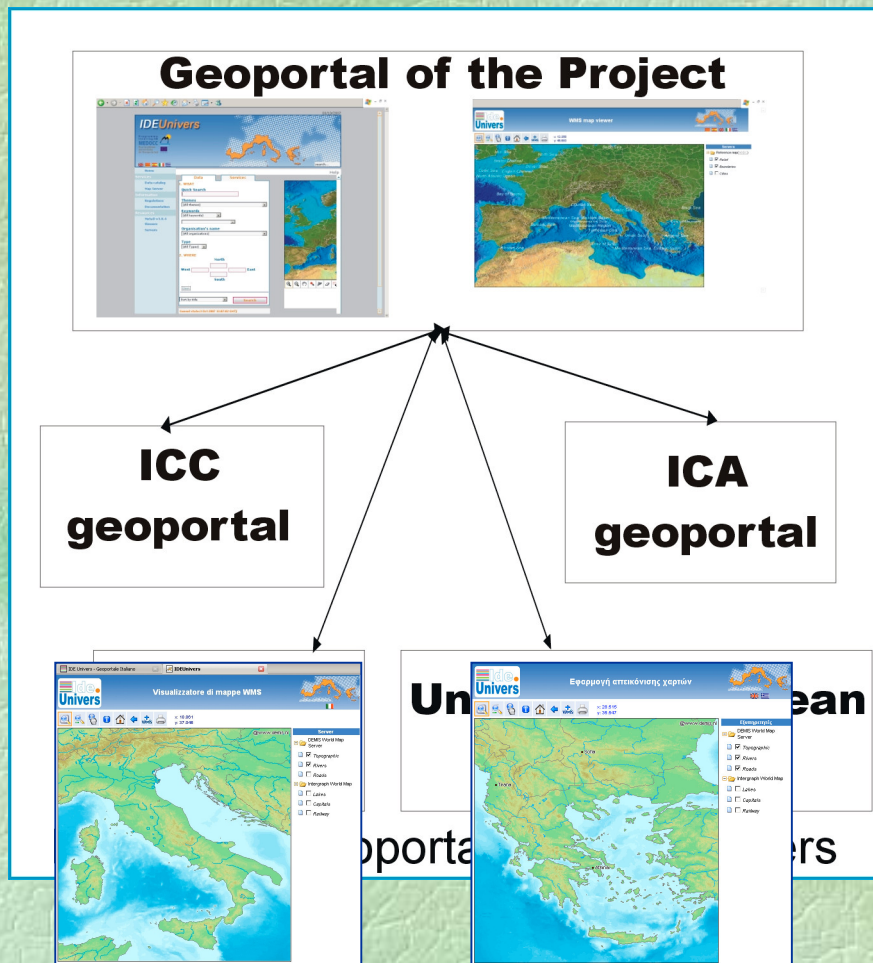

- Report on landslides in the area of Tartano (by Unimib-Sc.Amb. Dept.)
- Map of flood risk assessment in the area of Ardenno (by Polimi).
- Graduation thesis on the pastures of Albaredo (by Unimi-Agraria Dept.)
- Values of runoff forecast of Adda river (by CNR-IREA)
- Digital geologic map Lombardia (distributed by Unimib-Sc.Amb. and Agraria Depts.)
- ...other data...

## Searching data in catalogues

The screenshot shows the FAO GeoNetwork website interface. At the top, the browser address bar displays <http://www.fao.org/geonetwork/srv/en/main.home>. The website header includes the FAO logo, the text "GeoNetwork", and the tagline "[ Find and analyze geo-spatial data ]". Navigation links for "Home" and "Help" are present, along with a "Username" field.

The main content area is titled "FIND INTERACTIVE MAPS, GIS DATASETS, SATELLITE IMAGERY AND RELATED APPLICATIONS". On the left, there is a search interface with "What?" and "Where?" input fields, a "Search" button, and a "Featured map" section. The "Featured map" section displays "NEPAL CONSERVED AREA" with a thumbnail image of a map of Nepal and the description "Digital vector polygon data".

Below the search interface, there is a "Reset" button, "Advanced" and "Options" links, and a "CATEGORIES" list:

- Applications
- Audio/Video
- Case studies, best practices
- Conference proceedings
- Datasets
- Directories
- Interactive resources
- Maps & graphics
- Other information resources
- Photo

On the right side of the main content area, there is a section titled "GEONETWORK'S PURPOSE IS:" with a list of bullet points:

- To improve access to and integrated use of spatial data and information
- To support decision making
- To promote multidisciplinary approaches to sustainable development
- To enhance understanding of the benefits of geographic information

Below this list, there is a paragraph: "GeoNetwork opensource allows to easily share geographically referenced thematic information between different organizations. For more information please contact [GeoNetwork@fao.org](mailto:GeoNetwork@fao.org)".

# Using SDI: map service

The image displays two overlapping screenshots of the FAO GeoNetwork InterMap interface. The top screenshot shows the main map viewer with a toolbar containing buttons for 'Full extent', 'Zoom in', 'Zoom out', 'Pan', 'Identify', 'Print', and 'Bigger/Smaller map'. The bottom screenshot shows a detailed view of the 'Layers' panel on the left side of the interface. This panel lists two layers: 'Global Administrative Units (GAUL) - country level' and 'Aridity index'. Each layer has a 'Metadata' link, a visibility toggle (checked), a 'Refresh' button, and an 'opaque' dropdown menu. The main map area on the right shows a map of Europe with a color-coded overlay representing the aridity index. The scale at the bottom left of the map is 1:23,315,752.
