

Status and challenges of soils for nutrition

Vinisa Saynes Santillán

FAO-Global Soil Partnership Secretariat

Global Symposium on Soils for Nutrition | 26-29 July 2022

Soils perform functions, directly and indirectly, related to ecosystem services

Soils and SDGs

Healthy soils perform/provide key functions and ecosystem services

95 % of our food comes from soils

99 % of calories and 93 % of protein come from plants and animals ... **that all depend - directly or indirectly - on soils!**

Global Symposium on Soils for Nutrition | 26-29 July 2022

What do soils have to do with nutrition?

On earth

there are **92** naturally occurring **chemical elements**

18 are essential to plants and **15** of them are supplied by soils

The chronic lack of micronutrients from soils & crops causes severe and invisible health problems

Hidden hunger

affects over **2 billion people** worldwide

Brain and muscle function

Immune system

Fetal development and functioning of reproductive system

Composition of enzymes, DNA, RNA and proteins

What do soils have to do with nutrition?

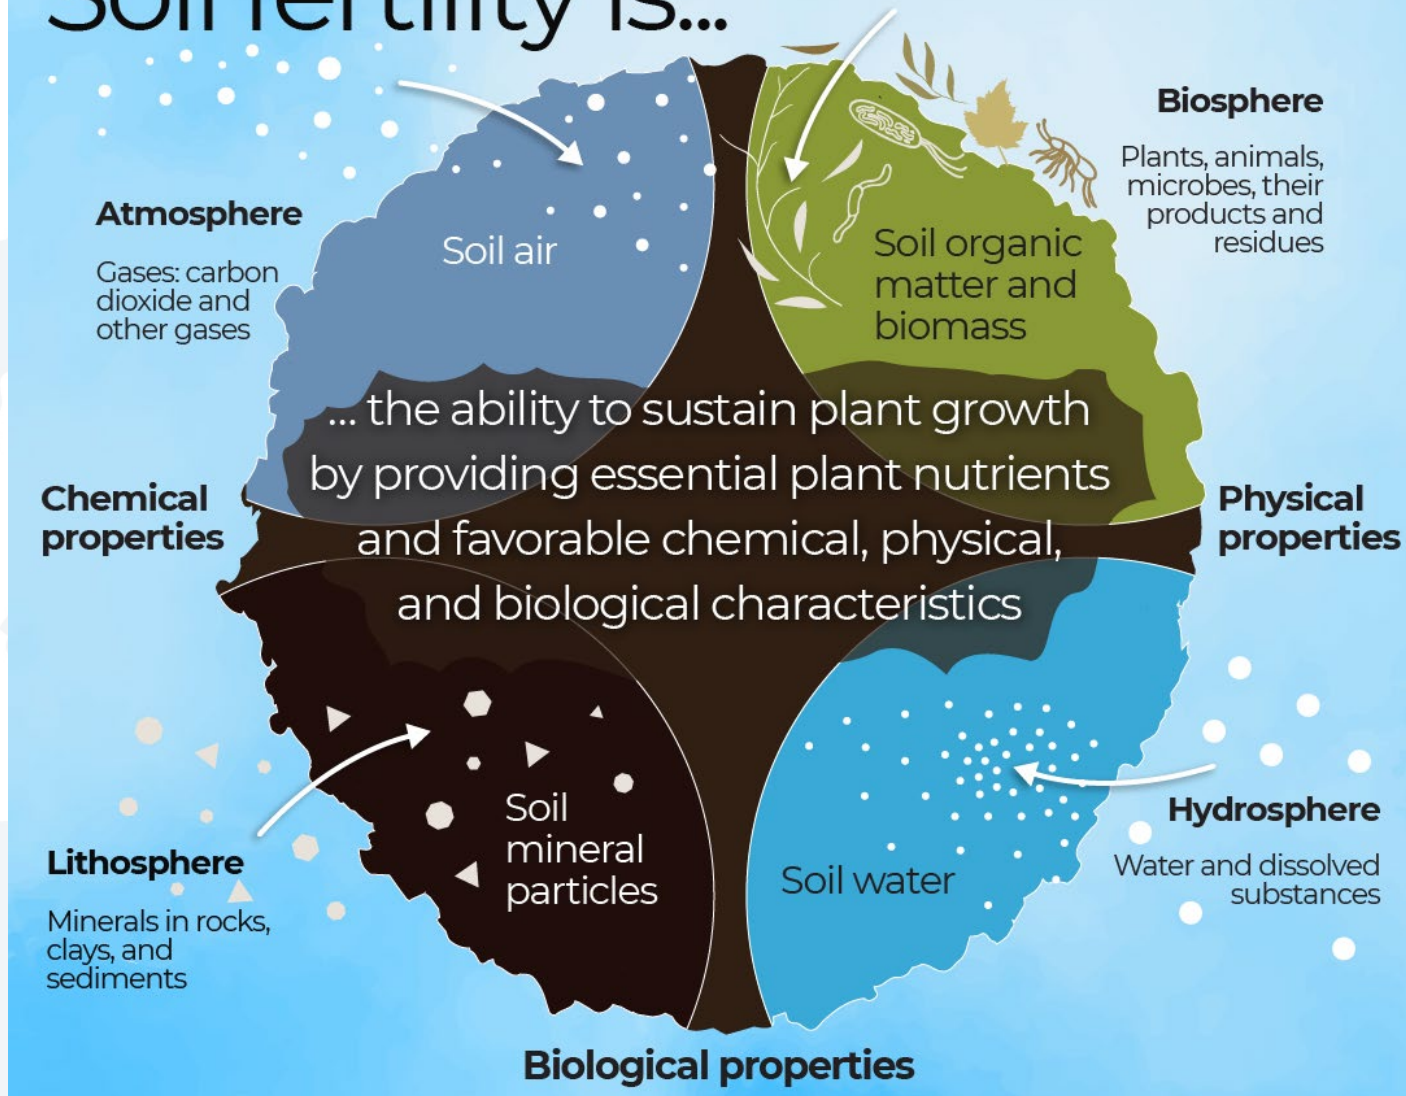

Fe deficiency: anemia

Zn deficiency: central nervous system, gastrointestinal, immune, epidermal, reproductive, and skeletal systems

Micronutrient deficiencies are now recognized as one of the leading causes of worldwide illness burden.

Soil fertility is...

What makes the transformation and availability of nutrients in soils possible?

Soil fertility!

Soil fertility depends on three key features, **physical**, **chemical** and **biological** properties, on which the supply of nutrients and the support for plant growth are based.

Global Symposium on Soils for Nutrition | 26-29 July 2022

Soil fertility is being lost

- ✓ Unsustainable agricultural practices such as,
 - Intensive tillage
 - Lack of soil organic matter
 - Monocropping systems
- ✓ Misuse and overuse of nutrients
- ✓ Underuse of nutrients
- ✓ Affections to soil biodiversity
- ✓ Soil degradation

Unawareness that soil is a living resource, not renewable in a human time scale

Unawareness of all the benefits that we obtain from soils.

....Soil is a hidden resource

Global Symposium on Soils for Nutrition | 26-29 July 2022

Unprecedented global challenges

Food insecurity and malnutrition

Two-thirds of the world's population is at risk of deficiency in one or more essential mineral elements

66%

Hidden hunger affecting more than **2 billion people** in the world .

Soil degradation

33%

One third of the soils in the world are degraded. Nutrient imbalances is one of the primary causes leading to soil degradation.

Global climate change and pollution

12% of annual anthropogenic GHG emissions worldwide

50% Half of the world's anthropogenic N₂O emissions are released during agricultural activities, which are dominated by N additions to croplands

Poverty, migration, war

26% Of the world population live in poverty

In 2017, there were **258 million international migrants**
In 2016, climate and water-related disasters were responsible for **23.5 million displacements**.

Global Symposium on Soils for Nutrition | 26-29 July 2022

Soil threats and how to combat them

Main soil threats

1. Erosion
2. Soil organic carbon loss
3. **Nutrient imbalance**
4. Salinization
5. Soil biodiversity loss

What to do?

1. Minimize soil erosion
2. Increase the organic matter content of the soil
3. **Promote soil nutrient cycling and balance**

Avoid nutrient imbalances

1. Underuse
2. Misuse
3. Overuse

Global Symposium on Soils for Nutrition | 26-29 July 2022

Nutrient underuse

Efficiency: about or lower than 50% for N, 10% for P, and 40% for K, meaning huge water and atmospheric losses to the environment.

Excess nutrients in agricultural soils lead to serious downstream **water-quality problems**.

About 80% of **ocean pollution** comes from land-based activities and it is enhanced by soil degradation and erosion.

Overuse or misuse of N fertilizers are **sources of N₂O**. Very powerful GHG with 268 times the warming power of CO₂.

Once N₂O reaches the atmosphere it can stay there for up to 120 years **warming the planet, polluting the air, reducing stratospheric ozone, and affecting human health**.

Agricultural activities account for **12 % of annual anthropogenic GHG emissions worldwide**.

38 % percent of these emissions result from the release of soil N₂O from synthetic fertilizers, manure, and crop residues, and 11 percent **from CH₄** in rice cultivation.

Tools to avoid nutrient imbalances

Fertilizer use must be guided by crop requirements, climatic conditions, and information on soil health status.

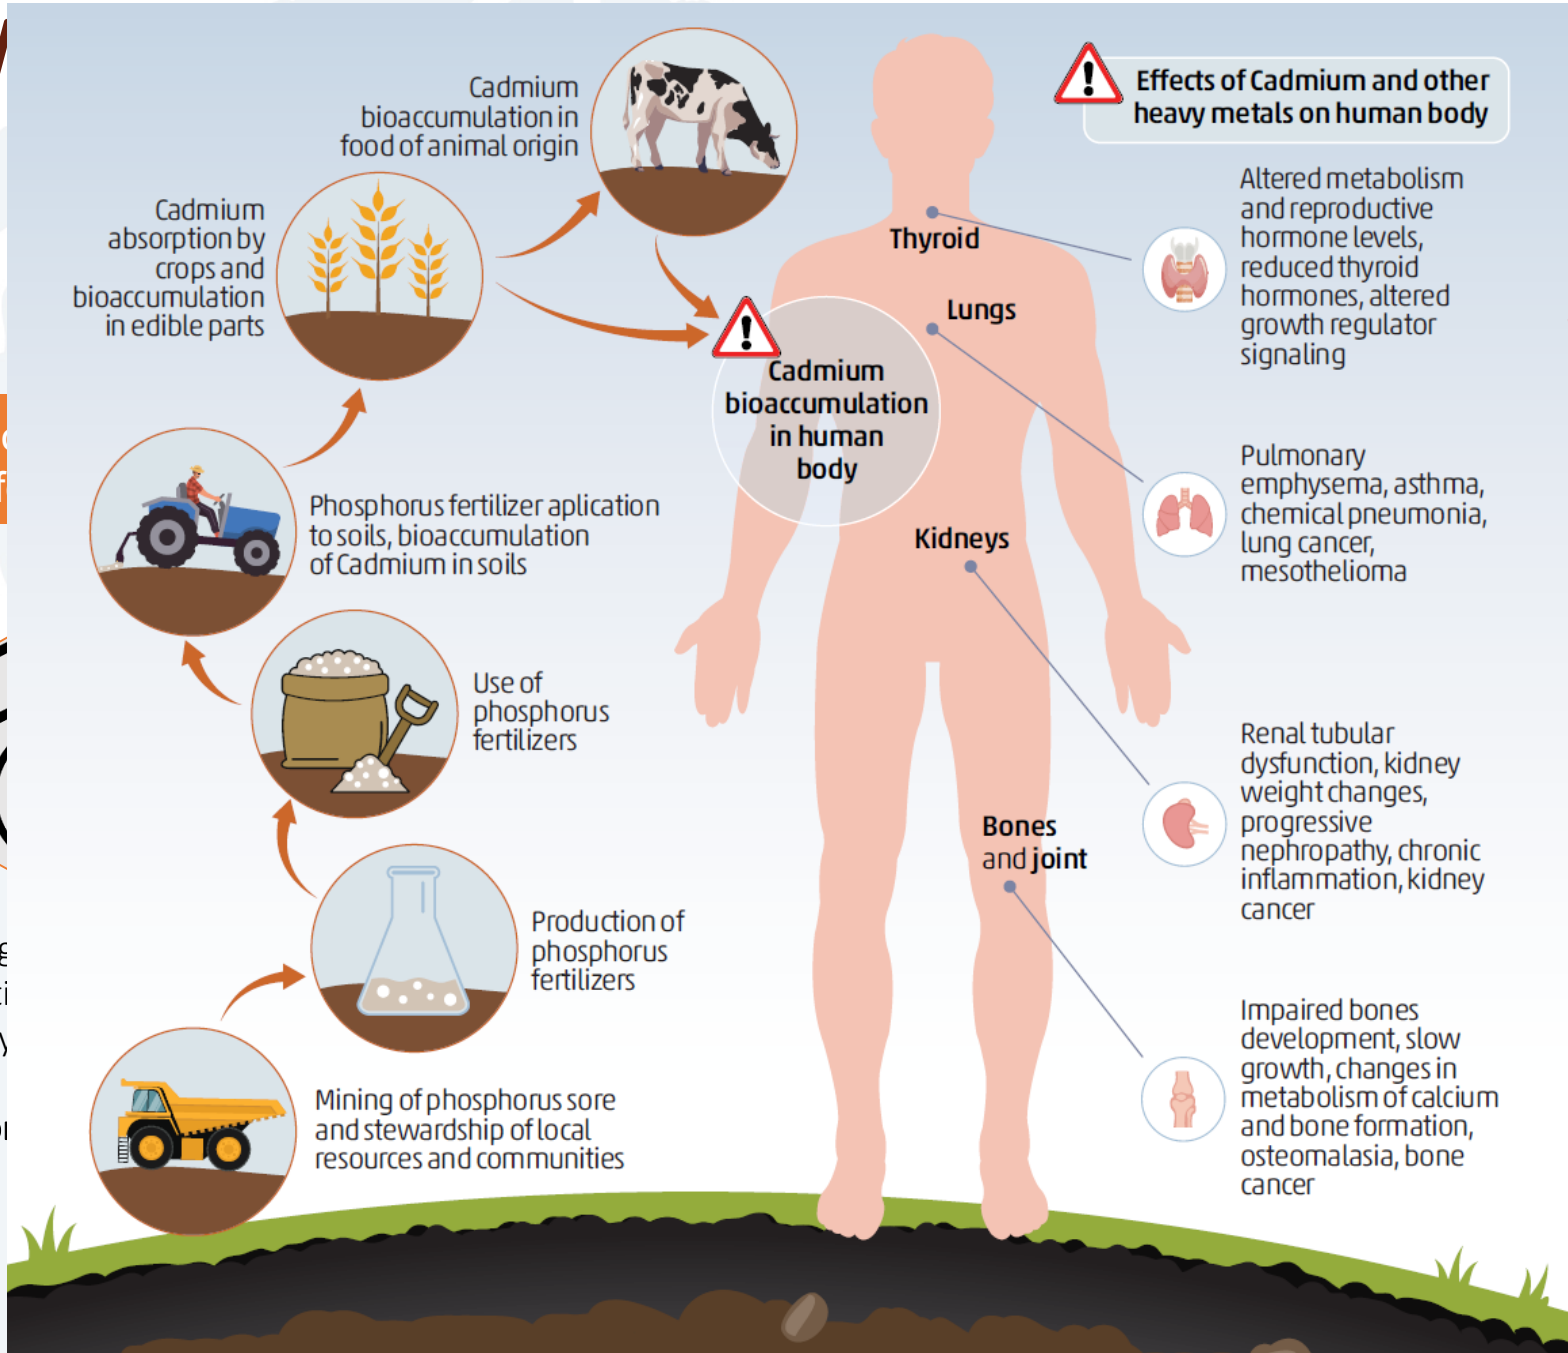

The Fertilizer Code shall guide the right use of fertilizers to avoid the misuse and overuse of fertilizers.

It is the product of the work of more than 50 top worldwide experts and associations.

The Fertilizer Code provides a locally adaptable framework and a voluntary set of practices to serve the different stakeholders directly or indirectly involved with fertilizers since the needs are different among stakeholders

Soil m

the actual
at an app

Strengthening of national capacities on sustainable soil nutrient management and rising awareness on the importance of physical, chemical, and biological soil properties for nutrient availability and cycling

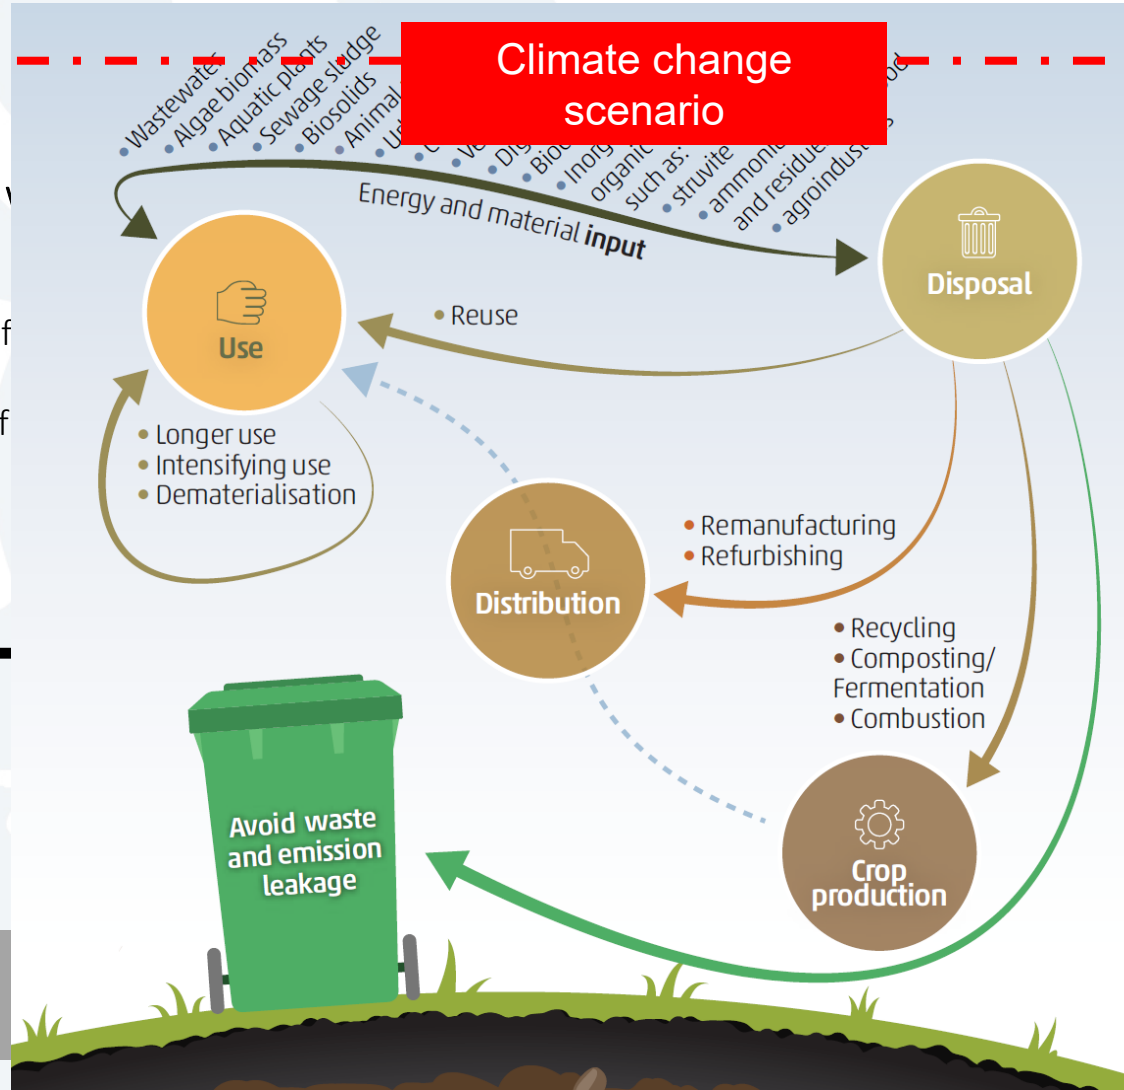

Empowering of farmers
Capacity development

What are the challenges?

Nutrition-sensitive agriculture

Not just more food, but also better food. Attention must be put on the nutritional value of food looking also at micronutrients and not only focusing on crop yields.

Health and social and economic crisis. COVID-19 and other diseases, social and military conflicts, and and fertilizer price increases aggravate food insecurity and further threaten soil health and fertility

Pandemics, social conflicts, and economy

What is expected from the symposium?

Aims to:

Review the state of the art on the role of soil fertility in delivering sufficient, high quality, safe, and more nutritious food for better nourished plants, animals, and people.

It is expected to:

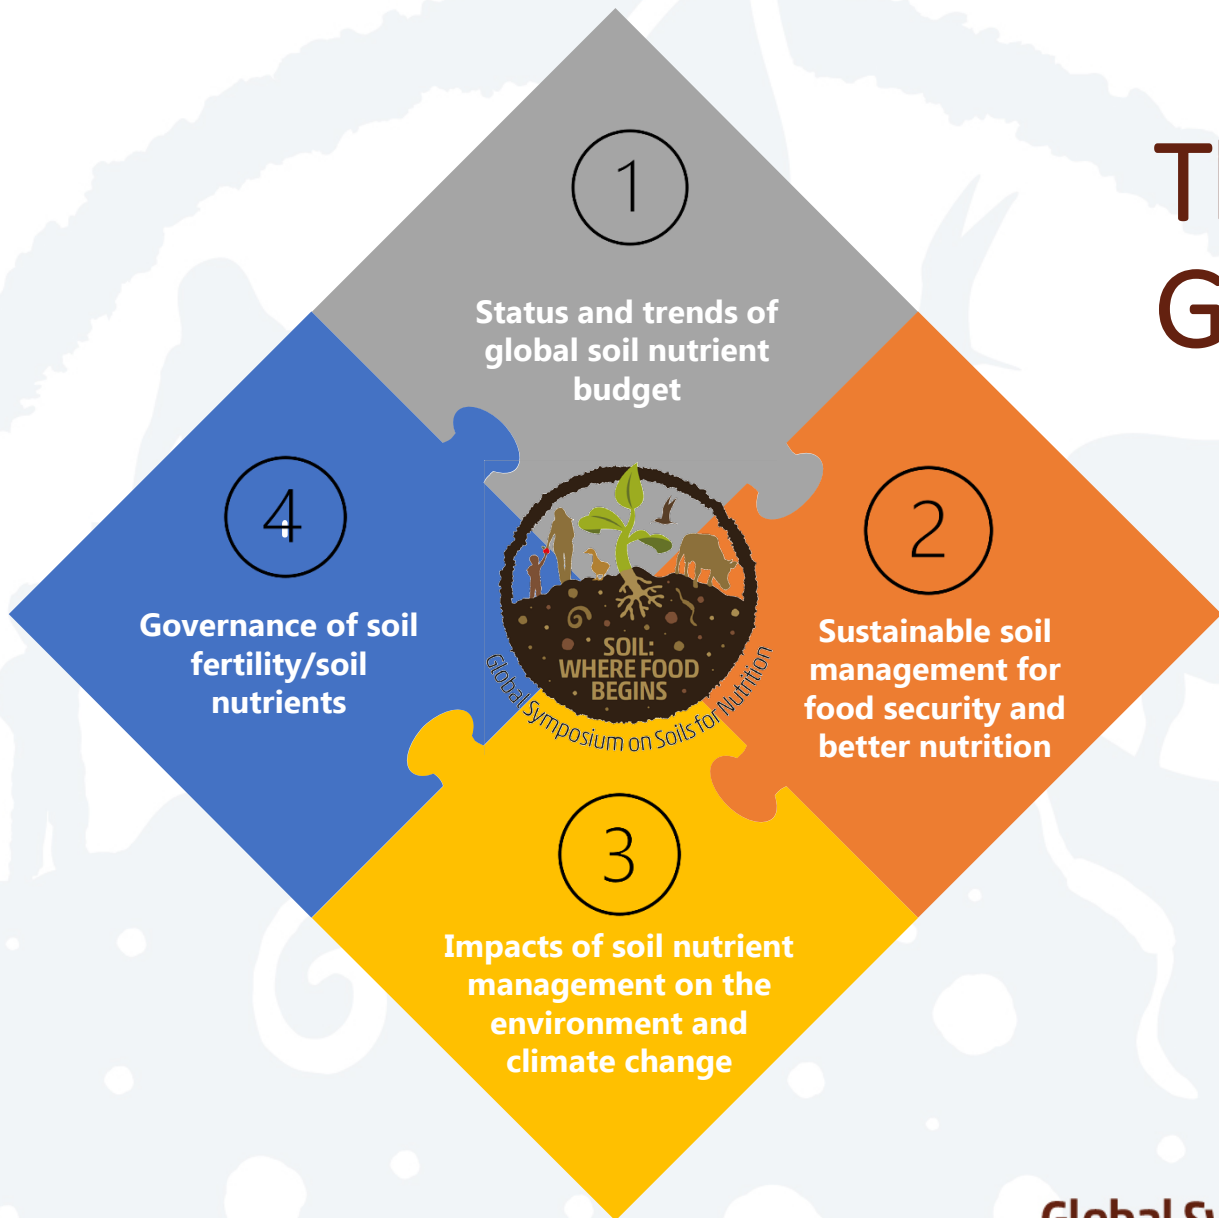

Identify critical knowledge gaps and provide the basis for discussion among key stakeholders on the: Creation of solutions that can provide more nutritious food
Enhanced One health
Protecting the environment.

Parallel sessions and posters

The latest research and findings on the GSOIL4N themes

Global Symposium on Soils for Nutrition | 26-29 July 2022

Key questions to be addressed

What is the outlook for soil fertility in the face of a challenging global scenario dominated by health crisis, food insecurity, fertilizer crisis, war, migration and poverty?

Do we really need fertilizers to grow crops?

What is the insight of the fertilizer industry in the face of a global scenario of underuse, misuse and overuse of fertilizers?

What are the alternatives to boost soil nutrients?

How do fertilizer misuse and overuse impact the environment and cause climate change?

How do policies and governance can support to overcome soil fertility loss and underuse, misuse and overuse of fertilizers?

Global Symposium on Soils for Nutrition | 26-29 July 2022

Global Symposium on Soils for Nutrition | 26-29 July 2022

Soils for nutrition: state of the art

- Available information & Knowledge gaps
 - Status and trends of nutrients needs and efficiency
 - Role of soils on nutrient assimilation
 - Impacts on misuse and overuse on environmental pollution and climate change
- Information to disseminate
 - Enhance soil health
 - Enhance nutritional food value
 - Ensure food quality and safety

Global Symposium on Soils for Nutrition | 26-29 July 2022

Thank you !
