PFAS Chemistry and Properties

- > 1000 compounds
- Lipid and water repellent
- Persistent, Stable – C-F Bond
- Ionic state (anion, cation, zwitterion)
- Different composition, sizes, structure, and functions
- Widely used, ubiquitous

Per- or poly fluorinated Tail (Hydro- and Oleophobic)

Heterogeneity

- Soil properties
- Organic Matter
- Clay mineralogy
- Salinity
- Hydrogeology

- Soil from over 40 sites in Australia and Fiji
- Australia:
 - Queensland
 - New south Wales
 - Victoria
 - South Australia
- Fiji:
 - Highly weathered, low activity clay minerals, variable charged
 - Collected from uncultivated and cultivated lands

(Umeh, Naidu et al. 2021, *Env. Sci. Tech*)

Soil Organic Carbon and Surface Chemical Properties Influence PFAS Retention in Soils

Soil Properties Influence PFAS Retention

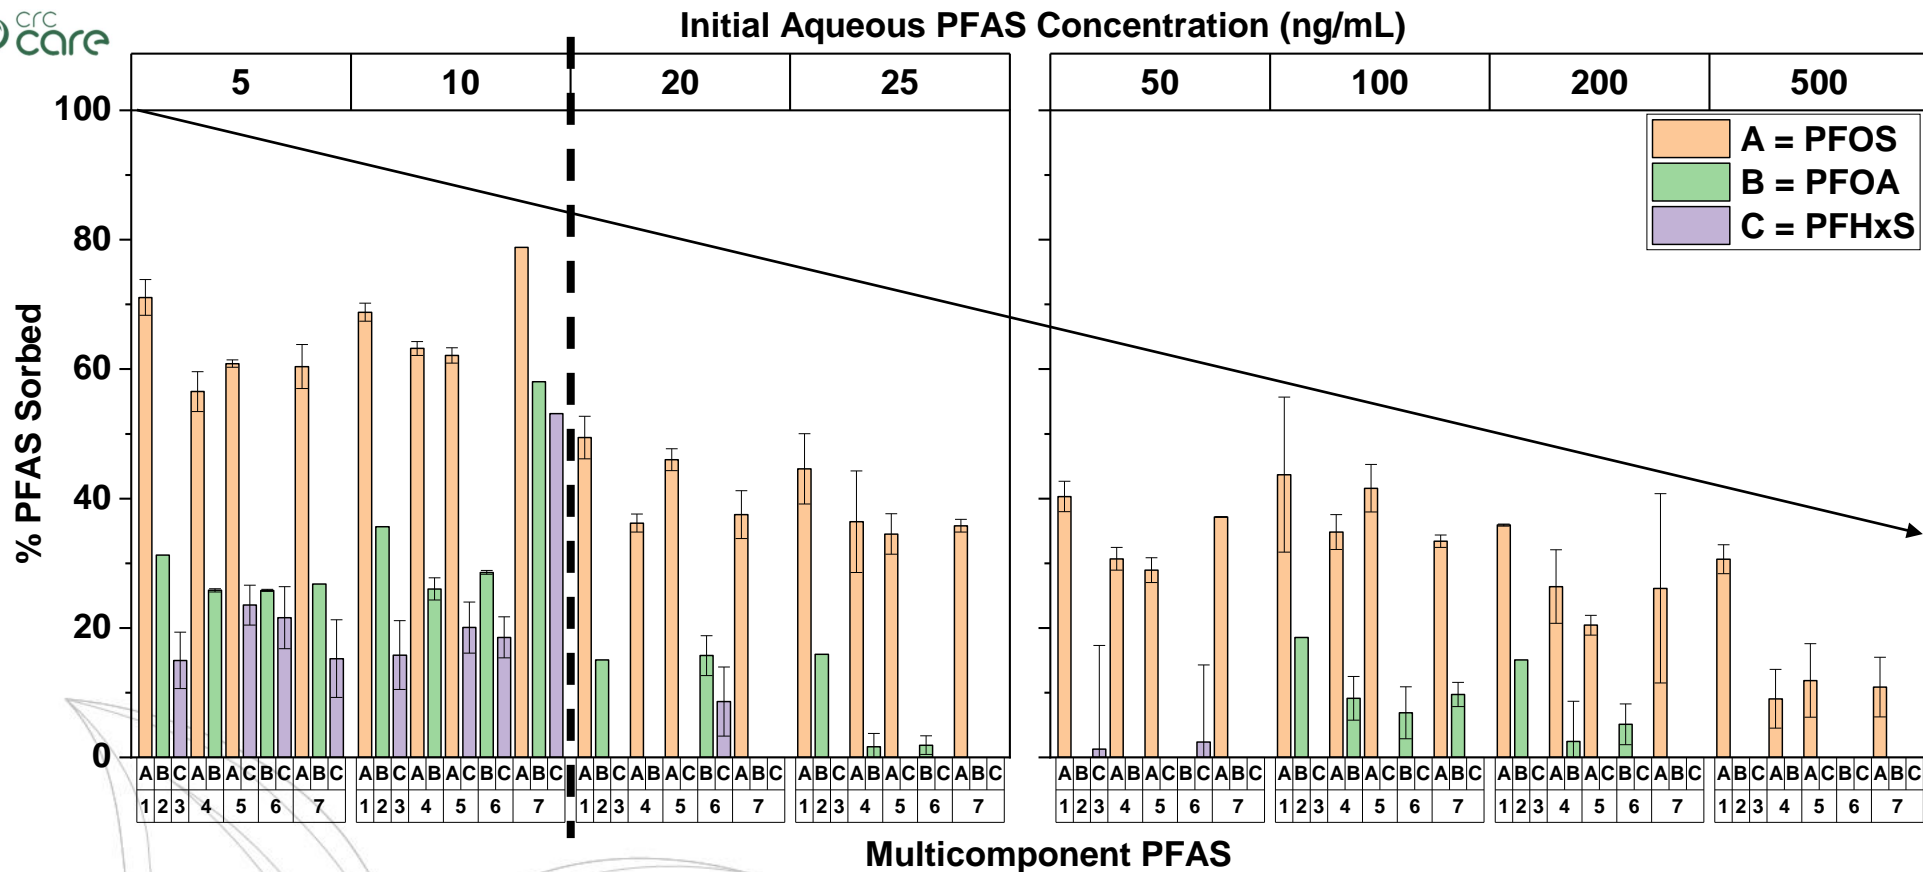

Key Points

- PFOS sorption range from 36.5– 95.3% (median: 69.3 in soils)
- Nonlinear sorption isotherms
- Soil Organic Carbon (TOC) alone explained only 35% of the variations in K_d .
- Key influencing soil properties include:
 - TOC, AEC, Oxalate-extractable Al & Fe oxides, pH and Silt content of soils
 - A sole K_{oc} approach is error-prone

(Umeh, Naidu et al. 2021, *Env. Sci. Tech*)

GLOBAL SYMPOSIUM on **SOILS** and **WATER** | 02-05 October, 2023

Mixture Effects on PFAS Retention

Legend

- 1 = A = PFOS
- 2 = B = PFOA
- 3 = C = PFHxS
- 4 = A+B: Ab, aB
- 5 = A+C: Ac, aC
- 6 = B+C: Bc, bC
- 7 = ABC: Abc, aBc, abC

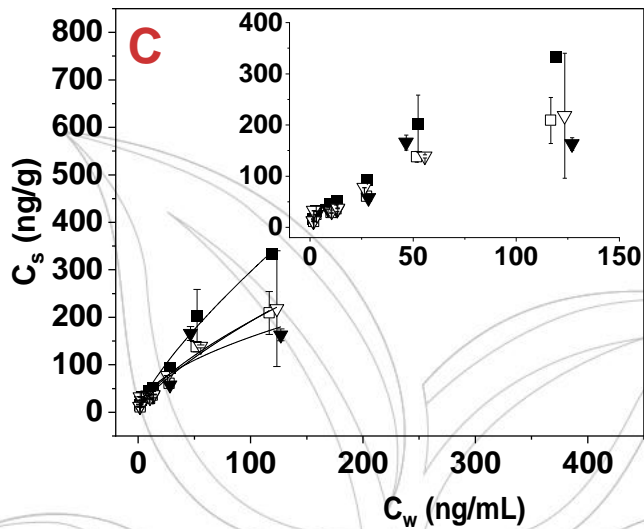

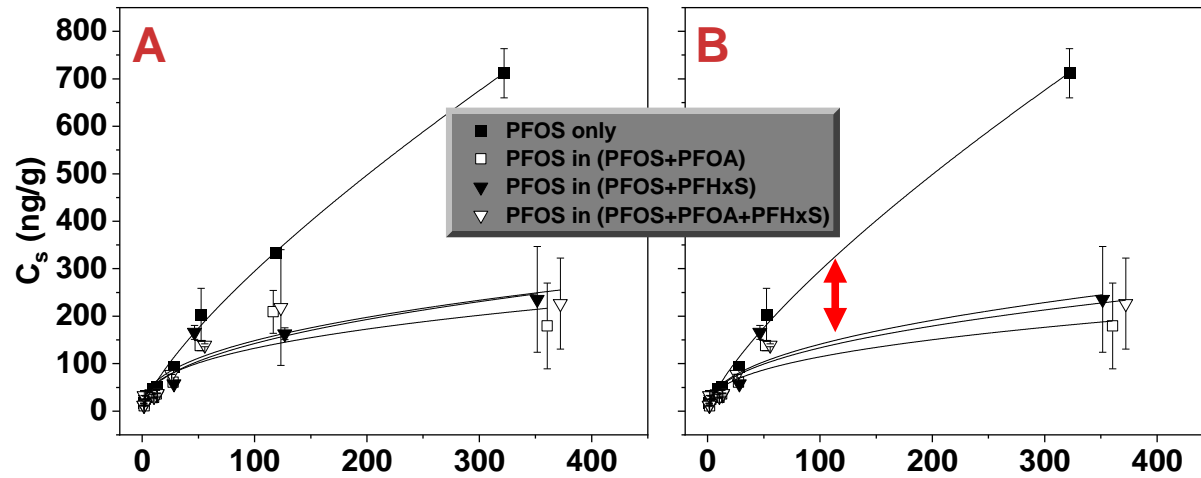

Umeh et al. (in Peer Review)

KEY POINTS:

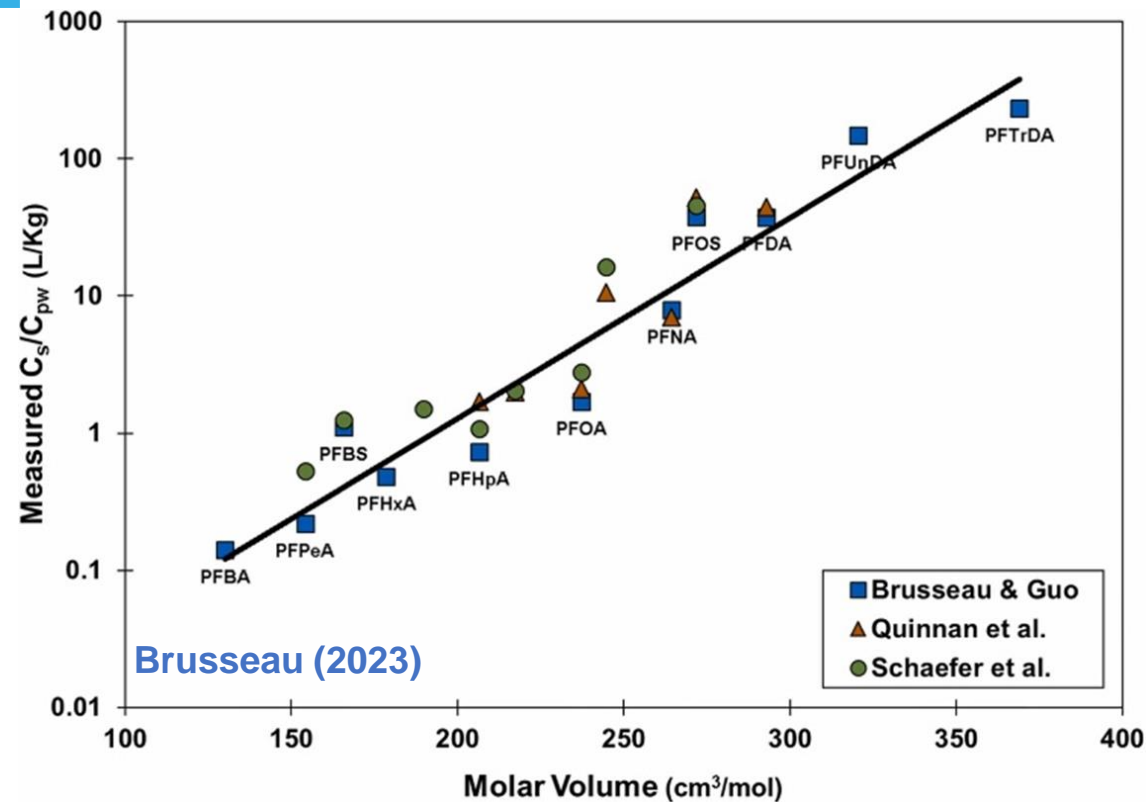

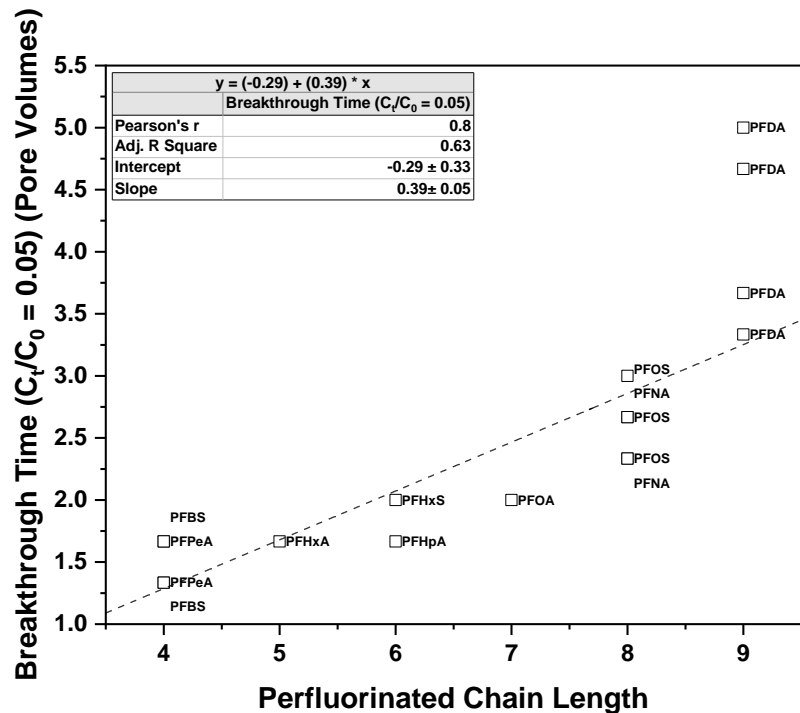

- Sorption followed PFOS > PFOA > PFHxS
- Generally decreasing % sorption as initial aqueous phase PFAS concentration increases
- % PFAS sorbed decreased in the presence of mixtures, especially for PFOA and PFHxS
- The influence of mixture interactions (competitive effects) on leachable and sorbed PFAS will be significant in saturated soils around source zone areas where PFAS concentrations are elevated, especially for PFOA and PFHxS.

Health effect

ABSTRACT

Drinking-water quality is a rising concern in the United States (US), emphasizing the need to broadly assess exposures and potential health effects at the point-of-use. Drinking-water exposures to per- and poly-fluoroalkyl substances (PFAS) are a national concern, however, there is limited information on PFAS in residential tapwater at the point-of-use, especially from private-wells. We conducted a national reconnaissance to compare human PFAS exposures in unregulated private-well and regulated public-supply tapwater. Tapwater from 716 locations (269 private-wells; 447 public supply) across the US was collected during 2016–2021 including three locations where temporal sampling was conducted. Concentrations of PFAS were assessed by three laboratories and compared with land-use and potential-source metrics to explore drivers of contamination. The number of individual PFAS observed ranged from 1 to 9 (median: 2) with corresponding cumulative concentrations (sum of detected PFAS) ranging from 0.348 to 346 ng/L. Seventeen PFAS were observed at least once with PFBS, PFHxS and PFOA observed most frequently in approximately 15% of the samples. Across the US, PFAS profiles and estimated median cumulative concentrations were similar among private wells and public-supply tapwater. We estimate that at least one PFAS could be detected in about 45% of US drinking-water samples. These detection probabilities varied spatially with limited temporal variation in concentrations/numbers of PFAS detected. Benchmark screening approaches indicated potential human exposure risk was dominated by PFOA and PFOS, when detected. Potential source and land-use information was related to cumulative PFAS concentrations, and the number of PFAS detected; however, corresponding relations with specific PFAS were limited likely due to low detection frequencies and higher detection limits. Information generated supports the need for further assessments of cumulative health risks of PFAS as a class and in combination with other co-occurring contaminants, particularly in unmonitored private-wells where information is limited or not available.

1. Introduction

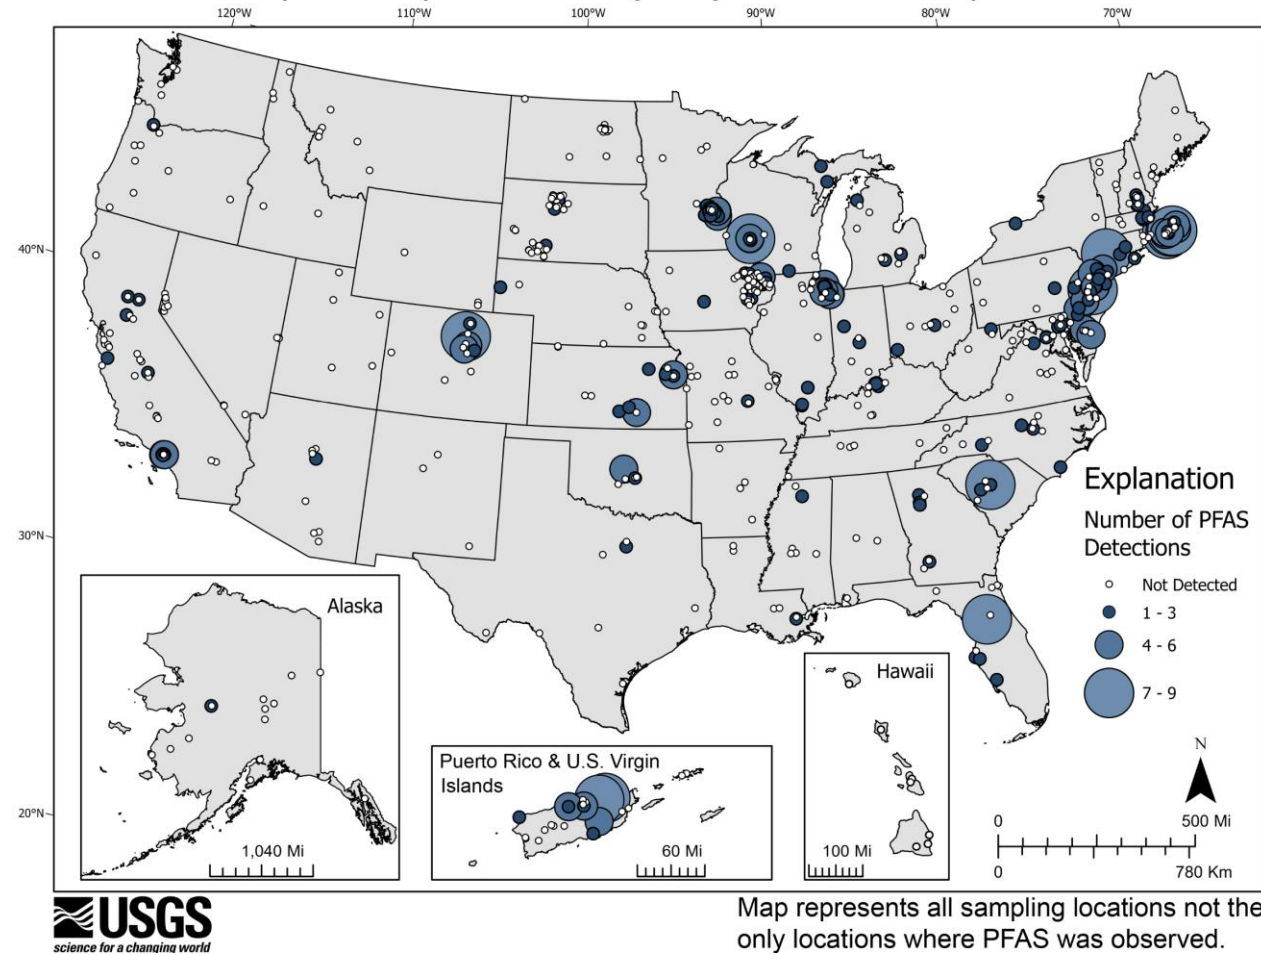

The quality and sustainability of drinking-water are rising concerns

in the United States (US) because of population-driven water demands, increasing contamination of drinking-water resources, and a growing understanding of potential human-health consequences associated with

GLOBAL SYMPOSIUM on **SOILS** and **WATER** | 02-05 October, 2023

International Network on Soil Pollution (INSOP)

TWG= Technical Working Group

INSOP WA approach: Soil and Water

Soil and water Working Group scope

International Network on Soil Pollution (INSOP)

Channelling collective action towards Zero Pollution

The Network

The International Network on Soil Pollution (INSOP) has the overall aim of stopping soil pollution and achieve the global goal of zero pollution. To this end, INSOP works to improve knowledge on the full cycle of soil pollution, from assessment to remediation, as well as on the effect on environmental and human health and the provision of soil ecosystem functions and services. It also aims to strengthen technical capacities and legislative frameworks for the prevention of soil pollution, and promotes the exchange of experiences and technologies for the sustainable management and remediation of polluted soils.

The scope

Most contaminants in aquatic ecosystems come from anthropogenic land-based sources. Therefore, soil management can have an enormous impact on water quality, including pollution. The overall objective of the soil and water Working Group (WG) is to raise awareness on the effects different contaminants of terrestrial origin could have on marine and aquatic ecosystems. Contaminants of concern such as plastic pollution of which 80% entering the ocean has a land origin, eutrophication and other land-based contaminants reaching the fresh and marine environments will be discussed and knowledge gaps addressed.

In collaboration with the assessment WG, the WG will create a knowledge exchange platform on the environmental and associated ecotoxicological risks on soil and water pollution. In addition, joint experts from the monitoring and remediation WG will work together to create a stronger regulation and policies which will protect and reduce the soil pollution impact on the aquatic environment.

Other tasks of interests and feasibility will be defined and agreed during the upcoming 'brainstorm' meeting which will be held in autumn 2022.

- Objective:
 - Strengthen knowledge on the environmental and associated ecotoxicological risks, environmental fate and behaviour of soil and water pollutants

<p>Address and strengthen environmental components of the One Health approach</p>	<p>Preparation of a publication and guidelines that reviews state-of-the-art knowledge of antimicrobial resistance (AMR) to enhance One Health action plan</p>

GLOBAL SYMPOSIUM on **SOILS** and **WATER** | 02-05 October, 2023

Key Conclusions And Looking Ahead

- Soil is an important reservoir for emerging chemicals, such as PFAS.
- Understanding the fate and behaviour of PFAS in soils is important for preventing extensive water contamination.
- The environmental behaviour of PFAS is dependent on physicochemical properties of soil, water, and PFAS.
- More research is required focusing on uncommon and short chain PFAS
- Need for more investments into research and testing of innovative technologies to cleanup PFAS in soil and water.
- Exposure to emerging chemicals, such as PFAS, can adversely impact the actualisation of the UN SDGs, if not effectively and quickly managed.
- Need for national, regional, and global cooperation to effectively understand the extent of PFAS contamination in soils and water, and to manage PFAS-contaminated sites, including capacity development in developing countries.
